- ▶ applications

## Subtext of today's lecture (and this course)

### Steps to developing a usable algorithm.

- Model the problem.
- Find an algorithm to solve it.
- Fast enough? Fits in memory?
- If not, figure out why.
- Find a way to address the problem.
- Iterate until satisfied.

### The scientific method.

### Mathematical analysis.

## Dynamic connectivity

### Given a set of objects

- **Union:** connect two objects.
- **Find:** is there a path connecting the two objects? ↗ more difficult problem: find the path

```
union(3, 4)
union(8, 0)
union(2, 3)
union(5, 6)
find(0, 2)    no
find(2, 4)    yes
union(5, 1)
union(7, 3)
union(1, 6)
union(4, 8)
find(0, 2)    yes
find(2, 4)    yes
```

- ▶ dynamic connectivity
- ▶ quick find
- ▶ quick union
- ▶ improvements
- ▶ applications

## Network connectivity: larger example

5

## Modeling the objects

Dynamic connectivity applications involve manipulating objects of all types.

- Variable name aliases.
- Pixels in a digital photo.
- Computers in a network.
- Web pages on the Internet.
- Transistors in a computer chip.
- Metallic sites in a composite system.

When programming, convenient to name objects 0 to N-1.

- Use integers as array index.
- Suppress details not relevant to union-find.

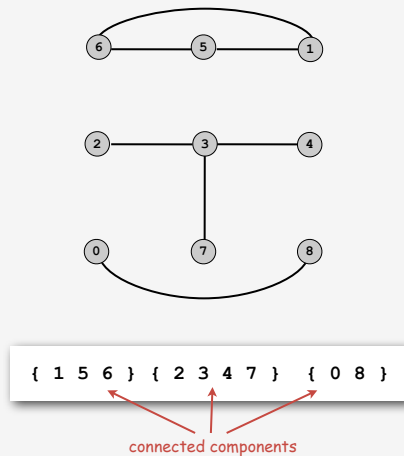

can use symbol table to translate from object names to integers (stay tuned)

6

## Modeling the connections

**Transitivity.** If  $p$  is connected to  $q$  and  $q$  is connected to  $r$ , then  $p$  is connected to  $r$ .

**Connected components.** Maximal **set** of objects that are mutually connected.

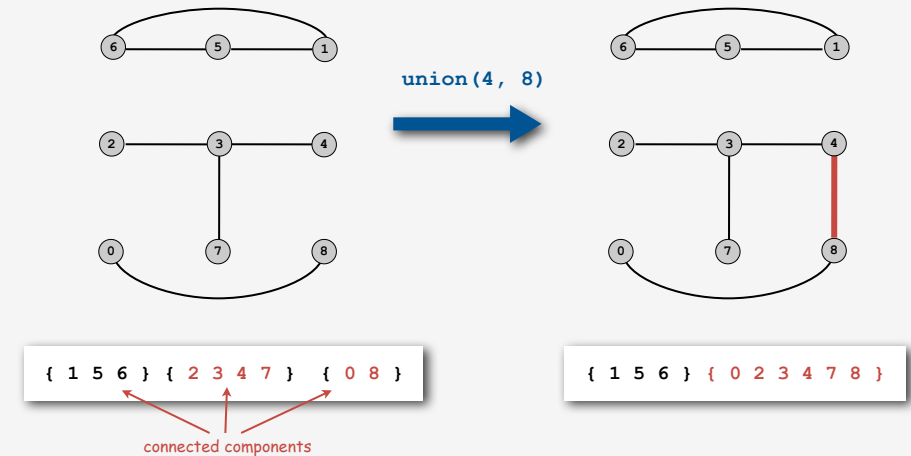

7

## Implementing the operations

**Find query.** Check if two objects are in the same set.

**Union command.** Replace sets containing two objects with their union.

8

## Union-find data type (API)

**Goal.** Design efficient data structure for union-find.

- Number of objects  $N$  can be huge.
- Number of operations  $M$  can be huge.
- Find queries and union commands may be intermixed.

```
public class UnionFind
{
    UnionFind(int N)           create union-find data structure with
                               N objects and no connections

    boolean find(int p, int q) are p and q in the same set?

    void unite(int p, int q)  replace sets containing p and q
                               with their union
}
```

10

## Quick-find [eager approach]

**Data structure.**

- Integer array `id[]` of size  $n$ .
- Interpretation:  $p$  and  $q$  are connected if they have the same id.

i	0	1	2	3	4	5	6	7	8	9
id[i]	0	1	9	9	9	6	6	7	8	9

5 and 6 are connected  
2, 3, 4, and 9 are connected

11

## Quick-find [eager approach]

**Data structure.**

- Integer array `id[]` of size  $n$ .
- Interpretation:  $p$  and  $q$  are connected if they have the same id.

i	0	1	2	3	4	5	6	7	8	9
id[i]	0	1	9	9	9	6	6	7	8	9

5 and 6 are connected  
2, 3, 4, and 9 are connected

**Find.** Check if  $p$  and  $q$  have the same id.

`id[3] = 9; id[6] = 6`  
3 and 6 not connected

12

## Quick-find [eager approach]

### Data structure.

- Integer array `id[]` of size `N`.
- Interpretation: `p` and `q` are connected if they have the same `id`.

<code>i</code>	0	1	2	3	4	5	6	7	8	9
<code>id[i]</code>	0	1	9	9	9	6	6	7	8	9

5 and 6 are connected  
2, 3, 4, and 9 are connected

**Find.** Check if `p` and `q` have the same `id`.

`id[3] = 9; id[6] = 6`  
3 and 6 not connected

**Union.** To merge sets containing `p` and `q`, change all entries with `id[p]` to `id[q]`.

<code>i</code>	0	1	2	3	4	5	6	7	8	9
<code>id[i]</code>	0	1	6	6	6	6	6	7	8	6

union of 3 and 6  
2, 3, 4, 5, 6, and 9 are connected

problem: many values can change

13

## Quick-find example

3-4 0 1 2 4 4 5 6 7 8 9  
4-9 0 1 2 9 9 5 6 7 8 9  
8-0 0 1 2 9 9 5 6 7 0 9  
2-3 0 1 9 9 9 5 6 7 0 9  
5-6 0 1 9 9 9 6 6 7 0 9  
5-9 0 1 9 9 9 9 9 7 0 9  
7-3 0 1 9 9 9 9 9 9 0 9  
4-8 0 1 0 0 0 0 0 0 0 0  
6-1 1 1 1 1 1 1 1 1 1 1

problem: many values can change

14

## Quick-find: Java implementation

```
public class QuickFind
{
    private int[] id;

    public QuickFind(int N)
    {
        id = new int[N];
        for (int i = 0; i < N; i++)
            id[i] = i;
    }

    public boolean find(int p, int q)
    {
        return id[p] == id[q];
    }

    public void unite(int p, int q)
    {
        int pid = id[p];
        for (int i = 0; i < id.length; i++)
            if (id[i] == pid) id[i] = id[q];
    }
}
```

set `id` of each object to itself  
(`N` operations)

check if `p` and `q` have same `id`  
(1 operation)

change all entries with `id[p]` to `id[q]`  
(`N` operations)

15

## Quick-find is too slow

### Quick-find defect.

- Union too expensive (`N` operations).
- Trees are flat, but too expensive to keep them flat.

algorithm	union	find
quick-find	<code>N</code>	1

Ex. Takes  $N^2$  operations to process sequence of `N` union commands on `N` objects.

16

## Quadratic algorithms do not scale

### Rough standard (for now).

- $10^9$  operations per second.
  - $10^9$  words of main memory.
  - Touch all words in approximately 1 second.
- a truism (roughly) since 1950 !*

### Ex. Huge problem for quick-find.

- $10^9$  union commands on  $10^9$  objects.
- Quick-find takes more than  $10^{18}$  operations.
- 30+ years of computer time!

### Paradoxically, quadratic algorithms get worse with newer equipment.

- New computer may be 10x as fast.
- But, has 10x as much memory so problem may be 10x bigger.
- With quadratic algorithm, takes 10x as long!

17

- › applications

18

## Quick-union [lazy approach]

### Data structure.

- Integer array `id[]` of size `n`.
  - Interpretation: `id[i]` is parent of `i`.
  - **Root** of `i` is `id[id[id[...id[i]...]]]`.
- Keep going until it doesn't change*

<code>i</code>	0	1	2	3	4	5	6	7	8	9
<code>id[i]</code>	0	1	9	4	9	6	6	7	8	9

3's root is 9; 5's root is 6

19

## Quick-union [lazy approach]

### Data structure.

- Integer array `id[]` of size `n`.
  - Interpretation: `id[i]` is parent of `i`.
  - **Root** of `i` is `id[id[id[...id[i]...]]]`.
- Keep going until it doesn't change*

<code>i</code>	0	1	2	3	4	5	6	7	8	9
<code>id[i]</code>	0	1	9	4	9	6	6	7	8	9

3's root is 9; 5's root is 6  
3 and 5 are not connected

**Find.** Check if `p` and `q` have the same root.

20

## Quick-union [lazy approach]

### Data structure.

- Integer array `id[]` of size `N`.
- Interpretation: `id[i]` is parent of `i`.
- Root of `i` is `id[id[id[...id[i]...]]]`.

<code>i</code>	0	1	2	3	4	5	6	7	8	9
<code>id[i]</code>	0	1	9	4	9	6	6	7	8	9

Keep going until it doesn't change

3's root is 9; 5's root is 6  
3 and 5 are not connected

**Find.** Check if `p` and `q` have the same root.

**Union.** To merge sets containing `p` and `q`, set the `id` of `p`'s root to the `id` of `q`'s root.

<code>i</code>	0	1	2	3	4	5	6	7	8	9
<code>id[i]</code>	0	1	9	4	9	6	9	7	8	9

only one value changes

21

## Quick-union example

3-4 0 1 2 4 4 5 6 7 8 9

4-9 0 1 2 4 9 5 6 7 8 9

8-0 0 1 2 4 9 5 6 7 0 9

2-3 0 1 9 4 9 5 6 7 0 9

5-6 0 1 9 4 9 6 6 7 0 9

5-9 0 1 9 4 9 6 9 7 0 9

7-3 0 1 9 4 9 6 9 9 0 9

4-8 0 1 9 4 9 6 9 9 0 0

6-1 1 1 9 4 9 6 9 9 0 0

problem:  
trees can get tall

22

## Quick-union: Java implementation

```

public class QuickUnion
{
    private int[] id;

    public QuickUnion(int N)
    {
        id = new int[N];
        for (int i = 0; i < N; i++) id[i] = i;
    }

    private int root(int i)
    {
        while (i != id[i]) i = id[i];
        return i;
    }

    public boolean find(int p, int q)
    {
        return root(p) == root(q);
    }

    public void unite(int p, int q)
    {
        int i = root(p), j = root(q);
        id[i] = j;
    }
}
    
```

set `id` of each object to itself  
(`N` operations)

chase parent pointers until reach root  
(depth of `i` operations)

check if `p` and `q` have same root  
(depth of `p` and `q` operations)

change root of `p` to point to root of `q`  
(depth of `p` and `q` operations)

23

## Quick-union is also too slow

### Quick-find defect.

- Union too expensive (`N` operations).
- Trees are flat, but too expensive to keep them flat.

### Quick-union defect.

- Trees can get tall.
- Find too expensive (could be `N` operations).

algorithm	union	find
quick-find	$N$	1
quick-union	$N^\dagger$	$N$

← worst case

† includes cost of finding root

24

- › dynamic connectivity
- › quick find
- › quick union
- › **improvements**
- › applications

## Improvement 1: weighting

### Weighted quick-union.

- Modify quick-union to avoid tall trees.
- Keep track of size of each set.
- Balance by linking small tree below large one.

### Ex. Union of 3 and 5.

- Quick union: link 9 to 6.
- Weighted quick union: link 6 to 9.

## Weighted quick-union example

3-4 0 1 2 3 3 5 6 7 8 9  
 4-9 0 1 2 3 3 5 6 7 8 3  
 8-0 8 1 2 3 3 5 6 7 8 3  
 2-3 8 1 3 3 3 5 6 7 8 3  
 5-6 8 1 3 3 3 5 5 7 8 3  
 5-9 8 1 3 3 3 3 5 7 8 3  
 7-3 8 1 3 3 3 3 5 3 8 3  
 4-8 8 1 3 3 3 3 5 3 3 3  
 6-1 8 3 3 3 3 3 5 3 3 3

no problem:  
trees stay flat

## Weighted quick-union: Java implementation

**Data structure.** Same as quick-union, but maintain extra array `sz[i]` to count number of objects in the tree rooted at `i`.

**Find.** Identical to quick-union.

```
return root(p) == root(q);
```

**Union.** Modify quick-union to:

- Merge smaller tree into larger tree.
- Update the `sz[]` array.

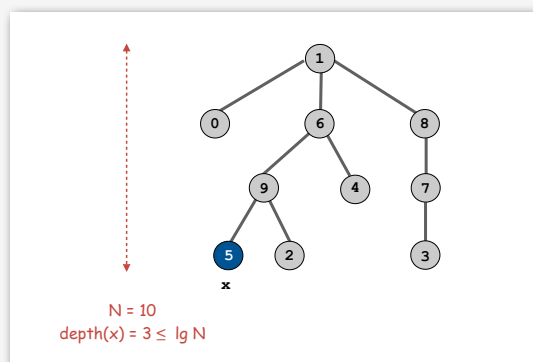

```
int i = root(p);
int j = root(q);
if (sz[i] < sz[j]) { id[i] = j; sz[j] += sz[i]; }
else { id[j] = i; sz[i] += sz[j]; }
```

## Weighted quick-union analysis

### Analysis.

- Find: takes time proportional to depth of  $p$  and  $q$ .
- Union: takes constant time, given roots.

**Proposition.** Depth of any node  $x$  is at most  $\lg N$ .

29

## Weighted quick-union analysis

### Analysis.

- Find: takes time proportional to depth of  $p$  and  $q$ .
- Union: takes constant time, given roots.

**Proposition.** Depth of any node  $x$  is at most  $\lg N$ .

**Pf.** When does depth of  $x$  increase?

Increases by 1 when tree  $T_1$  containing  $x$  is merged into another tree  $T_2$ .

- The size of the tree containing  $x$  at least doubles since  $|T_2| \geq |T_1|$ .
- Size of tree containing  $x$  can double at most  $\lg N$  times. Why?

30

## Weighted quick-union analysis

### Analysis.

- Find: takes time proportional to depth of  $p$  and  $q$ .
- Union: takes constant time, given roots.

**Proposition.** Depth of any node  $x$  is at most  $\lg N$ .

algorithm	union	find
quick-find	$N$	1
quick-union	$N^\dagger$	$N$
weighted QU	$\lg N^\dagger$	$\lg N$

$\dagger$  includes cost of finding root

**Q.** Stop at guaranteed acceptable performance?

**A.** No, easy to improve further.

31

## Improvement 2: path compression

**Quick union with path compression.** Just after computing the root of  $p$ , set the id of each examined node to  $\text{root}(p)$ .

32

## Path compression: Java implementation

**Standard implementation:** add second loop to `root()` to set the `id[]` of each examined node to the root.

**Simpler one-pass variant:** halve the path length by making every other node in path point to its grandparent.

```
public int root(int i)
{
    while (i != id[i])
    {
        id[i] = id[id[i]];
        i = id[i];
    }
    return i;
}
```

← only one extra line of code!

**In practice.** No reason not to! Keeps tree almost completely flat.

33

## Weighted quick-union with path compression example

```
3-4 0 1 2 3 3 5 6 7 8 9
4-9 0 1 2 3 3 5 6 7 8 3
8-0 8 1 2 3 3 5 6 7 8 3
2-3 8 1 3 3 3 5 6 7 8 3
5-6 8 1 3 3 3 5 5 7 8 3
5-9 8 1 3 3 3 3 5 7 8 3
7-3 8 1 3 3 3 3 5 3 8 3
4-8 8 1 3 3 3 3 5 3 3 3
6-1 8 3 3 3 3 3 3 3 3 3
```

no problem:  
trees stay VERY flat

34

## WQUPC performance

**Proposition.** [Tarjan 1975] Starting from an empty data structure, any sequence of  $M$  union and find ops on  $N$  objects takes  $O(N + M \lg^* N)$  time.

- Proof is very difficult.
- But the algorithm is still simple!

↑  
actually  $O(N + M \alpha(M, N))$   
see COS 423

### Linear algorithm?

- Cost within constant factor of reading in the data.
- In theory, WQUPC is not quite linear.
- In practice, WQUPC is linear.

↑  
because  $\lg^* N$  is a constant in this universe

N	$\lg^* N$
1	0
2	1
4	2
16	3
65536	4
$2^{65536}$	5

$\lg^*$  function  
number of times needed to take  
the  $\lg$  of a number until reaching 1

**Amazing fact.** No linear-time linking strategy exists.

35

## Summary

**Bottom line.** WQUPC makes it possible to solve problems that could not otherwise be addressed.

algorithm	worst-case time
quick-find	$M N$
quick-union	$M N$
weighted QU	$N + M \log N$
QU + path compression	$N + M \log N$
weighted QU + path compression	$N + M \lg^* N$

*M union-find operations on a set of N objects*

**Ex.** [ $10^9$  unions and finds with  $10^9$  objects]

- WQUPC reduces time from 30 years to 6 seconds.
- Supercomputer won't help much; good algorithm enables solution.

36

- dynamic connectivity
- quick find
- quick union
- improvements
- applications

37

## Union-find applications

- Percolation.
- Games (Go, Hex).
- ✓ Network connectivity.
- Least common ancestor.
- Equivalence of finite state automata.
- Hoshen-Kopelman algorithm in physics.
- Hinley-Milner polymorphic type inference.
- Kruskal's minimum spanning tree algorithm.
- Compiling equivalence statements in Fortran.
- Morphological attribute openings and closings.
- Matlab's `bwlabel()` function in image processing.

38

## Percolation

A model for many physical systems:

- N-by-N grid of sites.
- Each site is open with probability  $p$  (or blocked with probability  $1-p$ ).
- System **percolates** if top and bottom are connected by open sites.

39

## Percolation

A model for many physical systems:

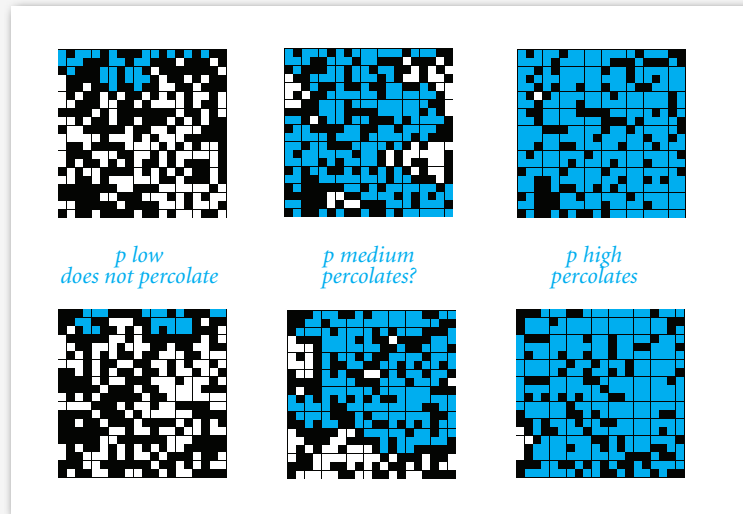

- N-by-N grid of sites.
- Each site is open with probability  $p$  (or blocked with probability  $1-p$ ).
- System **percolates** if top and bottom are connected by open sites.

model	system	vacant site	occupied site	percolates
electricity	material	conductor	insulated	conducts
fluid flow	material	empty	blocked	porous
social interaction	population	person	empty	communicates

40

## Likelihood of percolation

Depends on site vacancy probability  $p$ .

$N = 20$

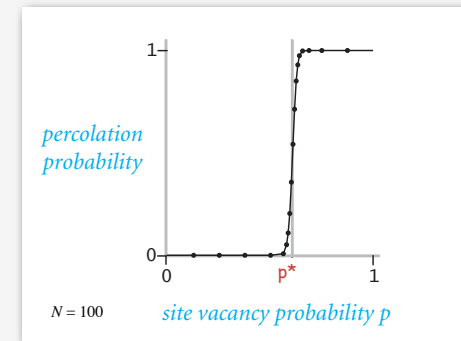

41

## Percolation phase transition

When  $N$  is large, theory guarantees a sharp threshold  $p^*$ .

- $p > p^*$ : almost certainly percolates.
- $p < p^*$ : almost certainly does not percolate.

Q. What is the value of  $p^*$  ?

42

## Monte Carlo simulation

- Initialize  $N$ -by- $N$  whole grid to be blocked.
- Declare random sites open until top connected to bottom.
- Vacancy percentage estimates  $p^*$ .

■ full open site  
(connected to top)  
■ empty open site  
(not connected to top)  
■ blocked site

43

## UF solution to find percolation threshold

How to check whether system percolates?

- Create an object for each site.
- Sites are in same set if connected by open sites.
- Percolates if any site in top row is in same set as any site in bottom row.

brute force algorithm needs to check  $N^2$  pairs

0	0	2	3	4	5	6	7
8	9	10	10	12	13	6	15
16	17	18	19	20	21	22	23
24	25	25	25	28	29	29	31
32	33	25	35	36	37	38	39
40	41	25	43	36	45	46	47
48	49	25	51	36	53	47	47
56	57	58	59	60	61	62	47

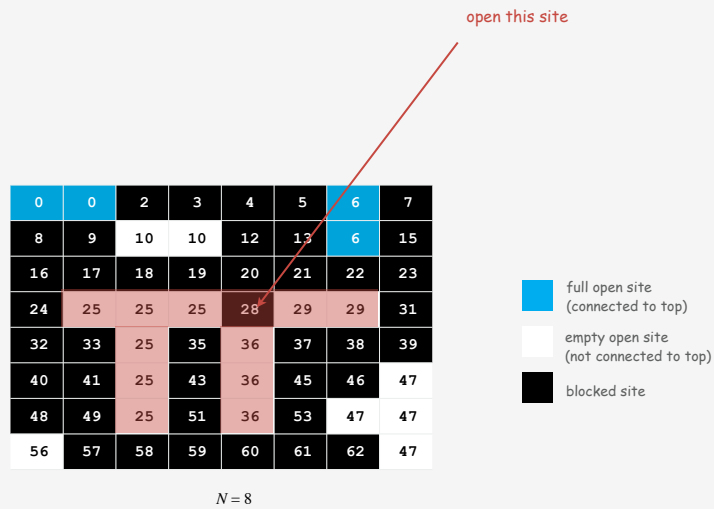

■ full open site  
(connected to top)  
■ empty open site  
(not connected to top)  
■ blocked site

$N = 8$

44

## UF solution to find percolation threshold

Q. How to declare a new site open?

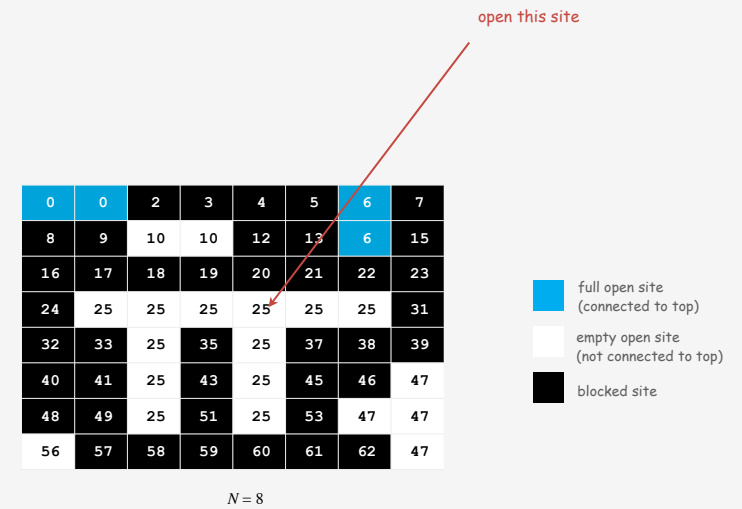

45

## UF solution to find percolation threshold

Q. How to declare a new site open?

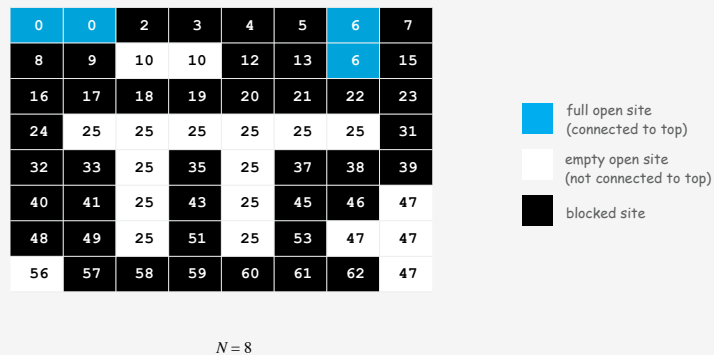

A. Take union of new site and all adjacent open sites.

46

## UF solution: a critical optimization

Q. How to avoid checking all pairs of top and bottom sites?

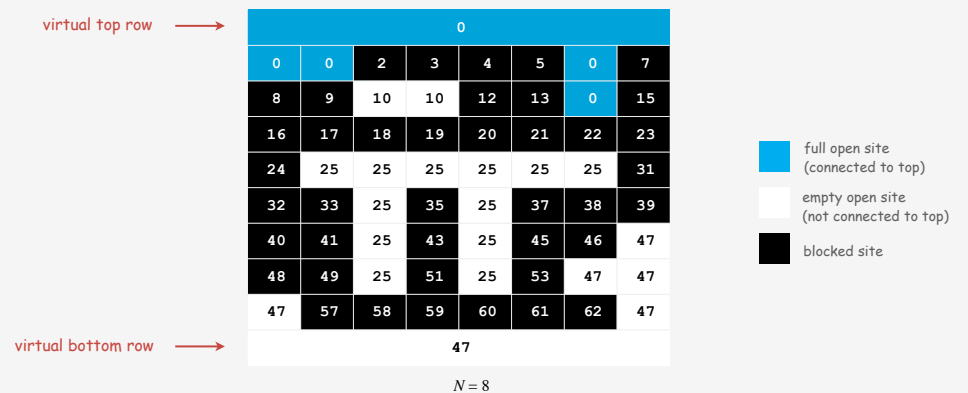

47

## UF solution: a critical optimization

Q. How to avoid checking all pairs of top and bottom sites?

A. Create a virtual top and bottom objects;

system percolates when virtual top and bottom objects are in same set.

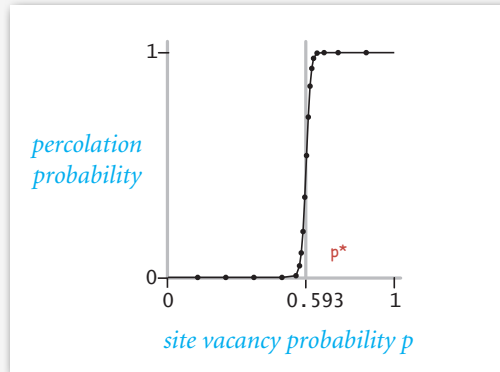

48

## Percolation threshold

Q. What is percolation threshold  $p^*$  ?

A. About 0.592746 for large square lattices.

↑  
percolation constant known  
only via simulation

49
