

## Sample sort client

Goal. Sort **any** type of data.

Ex 3. Sort the files in a given directory by filename.

```
import java.io.File;
public class FileSorter
{
    public static void main(String[] args)
    {
        File directory = new File(args[0]);
        File[] files = directory.listFiles();
        Insertion.sort(files);
        for (int i = 0; i < files.length; i++)
            StdOut.println(files[i].getName());
    }
}
```

```
% java FileSorter .
Insertion.class
Insertion.java
InsertionX.class
InsertionX.java
Selection.class
Selection.java
Shell.class
Shell.java
ShellX.class
ShellX.java
```

5

## Callbacks

Goal. Sort **any** type of data.

Q. How can `sort()` know to compare data of type `String`, `Double`, and `File` without any information about the type of a key?

Callbacks = reference to executable code.

- Client passes array of objects to `sort()` function.
- The `sort()` function calls back object's `compareTo()` method as needed.

Implementing callbacks.

- Java: **interfaces**.
- C: function pointers.
- C++: class-type functors.
- C#: delegates.
- Python, Perl, ML, Javascript: first-class functions.

6

## Callbacks: roadmap

client

```
import java.io.File;
public class FileSorter
{
    public static void main(String[] args)
    {
        File directory = new File(args[0]);
        File[] files = directory.listFiles();
        Insertion.sort(files);
        for (int i = 0; i < files.length; i++)
            StdOut.println(files[i].getName());
    }
}
```

object implementation

```
public class File
implements Comparable<File>
{
    ...
    public int compareTo(File b)
    {
        ...
        return -1;
        ...
        return +1;
        ...
        return 0;
    }
}
```

Comparable interface (built in to Java)

```
public interface Comparable<Item>
{
    public int compareTo(Item that);
}
```

sort implementation

```
public static void sort(Comparable[] a)
{
    int N = a.length;
    for (int i = 0; i < N; i++)
        for (int j = i; j > 0; j--)
            if (a[j].compareTo(a[j-1]) < 0)
                exch(a, j, j-1);
            else break;
}
```

key point: no reference to `File`

7

## Comparable API

Implement `compareTo()` so that `v.compareTo(w)`:

- Returns a negative integer if `v` is less than `w`.
- Returns a positive integer if `v` is greater than `w`.
- Returns zero if `v` is equal to `w`.
- Throw an exception if incompatible types or either is null.

```
public interface Comparable<Item>
{
    public int compareTo(Item that);
}
```

Required properties. Must ensure a **total order**.

- Reflexive:  $(v = v)$ .
- Antisymmetric: if  $(v < w)$  then  $(w > v)$ ; if  $(v = w)$  then  $(w = v)$ .
- Transitive: if  $(v \leq w)$  and  $(w \leq x)$  then  $(v \leq x)$ .

Built-in comparable types. `String`, `Double`, `Integer`, `Date`, `File`, ...

User-defined comparable types. Implement the `Comparable` interface.

8

## Implementing the Comparable interface: example 1

Date data type. Simplified version of `java.util.Date`.

```
public class Date implements Comparable<Date>
{
    private final int month, day, year;

    public Date(int m, int d, int y)
    {
        month = m;
        day = d;
        year = y;
    }

    public int compareTo(Date that)
    {
        if (this.year < that.year ) return -1;
        if (this.year > that.year ) return +1;
        if (this.month < that.month) return -1;
        if (this.month > that.month) return +1;
        if (this.day < that.day ) return -1;
        if (this.day > that.day ) return +1;
        return 0;
    }
}
```

only compare dates  
to other dates

9

## Implementing the Comparable interface: example 2

Domain names.

- Subdomain: `bolle.cs.princeton.edu`.
- Reverse subdomain: `edu.princeton.cs.bolle`.
- Sort by reverse subdomain to group by category.

```
public class Domain implements Comparable<Domain>
{
    private final String[] fields;
    private final int N;

    public Domain(String name)
    {
        fields = name.split("\\.");
        N = fields.length;
    }

    public int compareTo(Domain that)
    {
        for (int i = 0; i < Math.min(this.N, that.N); i++)
        {
            String s = fields[this.N - i - 1];
            String t = fields[that.N - i - 1];
            int cmp = s.compareTo(t);
            if (cmp < 0) return -1;
            else if (cmp > 0) return +1;
        }
        return this.N - that.N;
    }
}
```

only use this trick  
when no danger  
of overflow

subdomains

```
ee.princeton.edu
cs.princeton.edu
princeton.edu
cnn.com
google.com
apple.com
www.cs.princeton.edu
bolle.cs.princeton.edu
```

reverse-sorted subdomains

```
com.apple
com.cnn
com.google
edu.princeton
edu.princeton.cs
edu.princeton.cs.bolle
edu.princeton.cs.www
edu.princeton.ee
```

10

## Two useful sorting abstractions

Helper functions. Refer to data through compares and exchanges.

Less. Is object `v` less than `w`?

```
private static boolean less(Comparable v, Comparable w)
{ return v.compareTo(w) < 0; }
```

Exchange. Swap object in array `a[]` at index `i` with the one at index `j`.

```
private static void exch(Comparable[] a, int i, int j)
{
    Comparable swap = a[i];
    a[i] = a[j];
    a[j] = swap;
}
```

11

## Testing

Q. How to test if an array is sorted?

```
private static boolean isSorted(Comparable[] a)
{
    for (int i = 1; i < a.length; i++)
        if (less(a[i], a[i-1])) return false;
    return true;
}
```

Q. If the sorting algorithm passes the test, did it correctly sort its input?

A. Yes, if data accessed only through `exch()` and `less()`.

12

- ▶ rules of the game
- ▶ **selection sort**
- ▶ insertion sort
- ▶ sorting challenges
- ▶ shellsort

13

## Selection sort

**Algorithm.** ↑ scans from left to right.

**Invariants.**

- Elements to the left of ↑ (including ↑) fixed and in ascending order.
- No element to right of ↑ is smaller than any element to its left.

14

## Selection sort inner loop

To maintain algorithm invariants:

- Move the pointer to the right.

```
i++;
```

- Identify index of minimum item on right.

```
int min = i;
for (int j = i+1; j < N; j++)
    if (less(a[j], a[min]))
        min = j;
```

- Exchange into position.

```
exch(a, i, min);
```

15

## Selection sort: Java implementation

```
public class Selection
{
    public static void sort(Comparable[] a)
    {
        int N = a.length;
        for (int i = 0; i < N; i++)
        {
            int min = i;
            for (int j = i+1; j < N; j++)
                if (less(a[j], a[min]))
                    min = j;
            exch(a, i, min);
        }

        private static boolean less(Comparable v, Comparable w)
        { /* as before */ }

        private static void exch(Comparable[] a, int i, int j)
        { /* as before */ }
    }
}
```

16

## Selection sort: mathematical analysis

**Proposition.** Selection sort uses  $(N-1) + (N-2) + \dots + 1 + 0 \sim N^2/2$  compares and  $N$  exchanges.

i	min	0	1	2	3	4	5	6	7	8	9	10
		S	O	R	T	E	X	A	M	P	L	E
0	6	S	O	R	T	E	X	A	M	P	L	E
1	4	A	O	R	T	E	X	A	M	P	L	E
2	10	A	E	R	T	O	X	S	M	P	L	E
3	9	A	E	E	T	O	X	S	M	P	L	R
4	7	A	E	E	L	O	X	S	M	P	T	R
5	7	A	E	E	L	M	X	S	O	P	T	R
6	8	A	E	E	L	M	O	S	X	P	T	R
7	10	A	E	E	L	M	O	P	X	S	T	R
8	8	A	E	E	L	M	O	P	R	S	T	X
9	9	A	E	E	L	M	O	P	R	S	T	X
10	10	A	E	E	L	M	O	P	R	S	T	X

Trace of selection sort (array contents just after each exchange)

entries in black are examined to find the minimum

entries in red are a[min]

entries in gray are in final position

Running time insensitive to input. Quadratic time, even if input array is sorted. Data movement is minimal. Linear number of exchanges.

17

## Selection sort animations

19

- ▶ rules of the game
- ▶ selection sort
- ▶ insertion sort
- ▶ sorting challenges
- ▶ shellsort

20

## Insertion sort

**Algorithm.** ↑ scans from left to right.

**Invariants.**

- Elements to the left of ↑ (including ↑) are in ascending order.
- Elements to the right of ↑ have not yet been seen.

21

## Insertion sort inner loop

To maintain algorithm invariants:

- Move the pointer to the right.

```
i++;
```

- Moving from right to left, exchange  $a[i]$  with each larger element to its left.

```
for (int j = i; j > 0; j--)
    if (less(a[j], a[j-1]))
        exch(a, j, j-1);
    else break;
```

22

## Insertion sort: Java implementation

```
public class Insertion
{
    public static void sort(Comparable[] a)
    {
        int N = a.length;
        for (int i = 0; i < N; i++)
            for (int j = i; j > 0; j--)
                if (less(a[j], a[j-1]))
                    exch(a, j, j-1);
                else break;
    }

    private static boolean less(Comparable v, Comparable w)
    { /* as before */ }

    private static void exch(Comparable[] a, int i, int j)
    { /* as before */ }
}
```

23

## Insertion sort: mathematical analysis

**Proposition.** To sort a randomly-ordered array with distinct keys, insertion sort uses  $\sim \frac{1}{4} N^2$  compares and  $\sim \frac{1}{4} N^2$  exchanges on average.

**Pf.** Expect each element to move halfway back.

i	j	a[]

## Insertion sort: partially-sorted arrays

Def. An **inversion** is a pair of keys that are out of order.

A E E L M O T R X P S

T-R T-P T-S R-P X-P X-S

(6 inversions)

Def. An array is **partially sorted** if the number of inversions is  $O(N)$ .

- Ex 1. A small array appended to a large sorted array.
- Ex 2. An array with only a few elements out of place.

Proposition C. For partially-sorted arrays, insertion sort runs in linear time.

Pf. Number of exchanges equals the number of inversions.

↑  
number of compares = exchanges + (N-1)

## Diversion: how to shuffle an array

Knuth shuffle. [Fisher-Yates 1938]

- In iteration  $i$ , pick integer  $r$  between 0 and  $i$  uniformly at random.
- Swap  $a[i]$  and  $a[r]$ .

**Invariants.**

- Elements to the left of ↑ (including ↑) are shuffled.
- Elements to the right of ↑ have not yet been seen.

Proposition. Knuth shuffling algorithm produces a uniformly random permutation of the input array in linear time.

↑ assuming integers uniformly at random

32

## Diversion: how to shuffle an array

### Knuth shuffle. [Fisher-Yates 1938]

- In iteration  $i$ , pick integer  $r$  between 0 and  $i$  uniformly at random.
- Swap  $a[i]$  and  $a[r]$ .

```
public class StdRandom
{
    ...
    public static void shuffle(Object[] a)
    {
        int N = a.length;
        for (int i = 0; i < N; i++) {
            int r = i + StdRandom.uniform(1 + i); ← between 0 and i
            exch(a, i, r);
        }
    }
}
```

33

## War story (Microsoft)

Microsoft antitrust probe by EU. Microsoft agreed to provide a randomized ballot screen for users to select browser in Windows 7.

<http://www.browserchoice.eu>

### Select your web browser(s)

appeared last  
50% of the time

34

## War story (Microsoft)

Shuffling algorithm by sorting. Assign a random value to each card; sort.

- Uniformly random shuffle, provided no duplicate values.
- Useful in spreadsheets.

Browser	Value
Firefox	0.406782
Chrome	0.134853
Opera	0.590623
Safari	0.343267
IE 8	0.876543

Browser	Value
Chrome	0.134853
Safari	0.343267
Firefox	0.406782
Opera	0.590623
IE 8	0.876543

Microsoft's implementation in Javascript

```
function RandomSort (a,b)
{
    return (0.5 - Math.random()); ← browser comparator
}                                     (should implement a total order)
```

35

## War story (online poker)

Texas hold'em poker. Software must shuffle electronic cards.

How We Learned to Cheat at Online Poker: A Study in Software Security  
<http://itmanagement.earthweb.com/entdev/article.php/616221>

36

## War story (online poker)

Shuffling algorithm in FAQ at [www.planetpoker.com](http://www.planetpoker.com)

```
for i := 1 to 52 do begin
  r := random(51) + 1; ← between 1 and 51
  swap := card[r];
  card[r] := card[i];
  card[i] := swap;
end;
```

- Bug 1. Random number  $r$  never 52  $\Rightarrow$  52<sup>nd</sup> card can't end up in 52<sup>nd</sup> place.
- Bug 2. Shuffle not uniform.
- Bug 3. `random()` uses 32-bit seed  $\Rightarrow$  2<sup>32</sup> billion possible shuffles.
- Bug 4. Seed = milliseconds since midnight  $\Rightarrow$  86.4 million possible shuffles.

“The generation of random numbers is too important to be left to chance.”  
— Robert R. Coveyou

37

## War story (online poker)

Best practices for shuffling (if your business depends on it).

- Use a hardware random-number generator that has passed
- FIPS 140-2 and the NIST statistical test suite.
- Continuously monitor statistic properties because hardware random-number generators are fragile and fail silently.
- Use an unbiased shuffling algorithm.

Bottom line. Shuffling a deck of cards is hard!

38

## Sorting challenge 0

Input. Array of doubles.

Plot. Data proportional to length.

Name the sorting method.

- Insertion sort.
- Selection sort.

39

## Sorting challenge 1

Problem. Sort a file of huge records with tiny keys.

Ex. Reorganize your MP3 files.

Which sorting method to use?

- System sort.
- Insertion sort.
- Selection sort.

file  $\rightarrow$

Fox	1	A	243-456-9091	101 Brown

- shell sort

44

## Shellsort overview

Idea. Move elements more than one position at a time by *h-sorting* the array.

an *h*-sorted array is *h* interleaved sorted subsequences

Shellsort. [Shell 1959] *h-sort* the array for decreasing sequence of values of *h*.

```

input  S H E L L S O R T E X A M P L E
13-sort P H E L L S O R T E X A M S L E
4-sort  L E E A M H L E P S O L T S X R
1-sort  A E E E H L L L M O P R S S T X
    
```

45

## h-sorting

How to *h-sort* an array? Insertion sort, with stride length *h*.

3-sorting an array

Why insertion sort?

- Big increments  $\Rightarrow$  small subarray.
- Small increments  $\Rightarrow$  nearly in order. [stay tuned]

46

Shellsort example: increments 7, 3, 1

input

```
S O R T E X A M P L E
```

7-sort

```

S O R T E X A M P L E
M O R T E X A S P L E
M O R T E X A S P L E
M O L T E X A S P R E
M O L E E X A S P R T
    
```

3-sort

```

M O L E E X A S P R T
E O L M E X A S P R T
E E L M O X A S P R T
A E L E O X M S P R T
A E L E O X M S P R T
A E L E O P M S X R T
A E L E O P M S X R T
A E L E O P M S X R T
    
```

1-sort

```

A E L E O P M S X R T
A E L E O P M S X R T
A E L E O P M S X R T
A E E L O P M S X R T
A E E L O P M S X R T
A E E L M O P S X R T
A E E L M O P S X R T
A E E L M O P R S X T
A E E L M O P R S T X
    
```

result

```
A E E L M O P R S T X
```

47

Shellsort: intuition

Proposition. A *g*-sorted array remains *g*-sorted after *h*-sorting it.

7-sort

```

M O R T E X A S P L E
M O R T E X A S P L E
M O L T E X A S P R E
M O L E E X A S P R T
M O L E E X A S P R T
    
```

3-sort

```

M O L E E X A S P R T
E O L M E X A S P R T
E E L M O X A S P R T
E E L M O X A S P R T
A E L E O X M S P R T
A E L E O X M S P R T
A E L E O P M S X R T
A E L E O P M S X R T
A E L E O P M S X R T
A E L E O P M S X R T
    
```

still 7-sorted

Challenge for the bored. Prove this fact—it's more subtle than you'd think!

48

## Which increment sequence to use?

Powers of two. 1, 2, 4, 8, 16, 32, ...

No.

Powers of two minus one. 1, 3, 7, 15, 31, 63, ...

Maybe.

→  $3x + 1$ . 1, 4, 13, 40, 121, 364, ...

OK. Easy to compute.

merging of  $(9 \times 4) - (9 \times 2) + 1$  and  $4^1 - (3 \times 2) + 1$

Sedgewick. 1, 5, 19, 41, 109, 209, 505, 929, 2161, 3905, ...

Good. Tough to beat in empirical studies.

## Interested in learning more?

- See Section 6.8 of Algs, 3<sup>rd</sup> edition or Volume 3 of Knuth for details.
- Do a JP on the topic.

49

## Shellsort: Java implementation

```
public class Shell
{
    public static void sort(Comparable[] a)
    {
        int N = a.length;

        int h = 1;
        while (h < N/3) h = 3*h + 1; // 1, 4, 13, 40, 121, 364, 1093, ...

        while (h >= 1)
        { // h-sort the array.
            for (int i = h; i < N; i++)
            {
                for (int j = i; j >= h && less(a[j], a[j-h]); j -= h)
                    exch(a, j, j-h);
            }

            h = h/3;
        }
    }

    private static boolean less(Comparable v, Comparable w)
    { /* as before */ }
    private static boolean void(Comparable[] a, int i, int j)
    { /* as before */ }
}
```

3x+1 increment sequence

insertion sort

move to next increment

53

## Shellsort: analysis

**Proposition.** The worst-case number of compares used by shellsort with the  $3x+1$  increments is  $O(N^{3/2})$ .

**Property.** The number of compares used by shellsort with the  $3x+1$  increments is at most by a small multiple of  $N$  times the # of increments used.

N	compares	$N^{1.289}$	$2.5 N \lg N$
5,000	93	58	106
10,000	209	143	230
20,000	467	349	495
40,000	1022	855	1059
80,000	2266	2089	2257

measured in thousands

**Remark.** Accurate model has not yet been discovered (!)

54

## Why are we interested in shellsort?

Example of simple idea leading to substantial performance gains.

Useful in practice.

- Fast unless array size is huge.
- Tiny, fixed footprint for code (used in embedded systems).
- Hardware sort prototype.

Simple algorithm, nontrivial performance, interesting questions.

- Asymptotic growth rate?
- Best sequence of increments? ← open problem: find a better increment sequence
- Average-case performance?

**Lesson.** Some good algorithms are still waiting discovery.

55
