4.2 Directed Graphs

- digraph API
- digraph search
- topological sort
- strong components

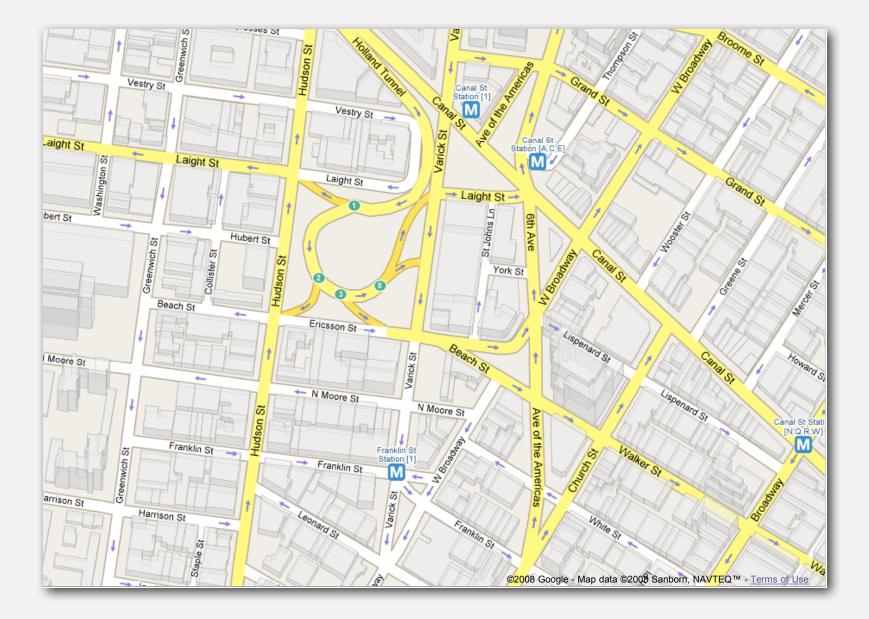

Directed graphs

Digraph. Set of vertices connected pairwise by directed edges.

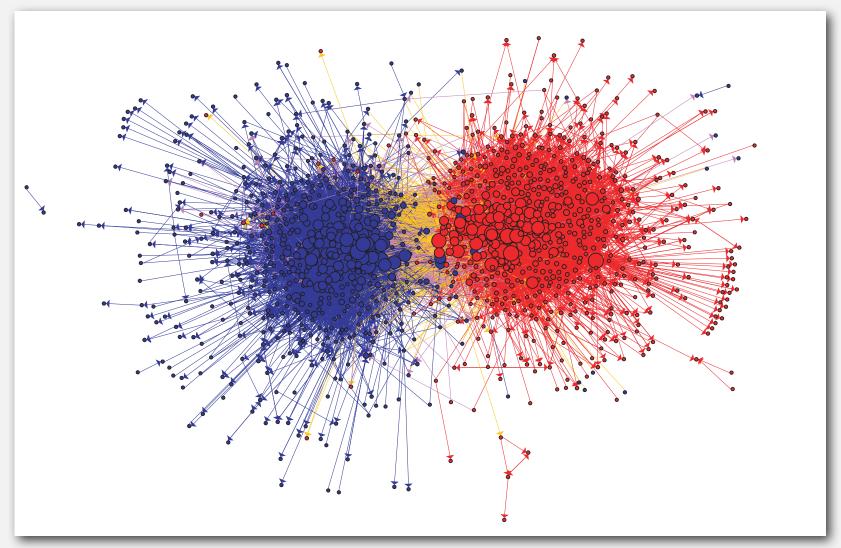

Road network

Vertex = intersection; edge = one-way street.

Political blogosphere graph

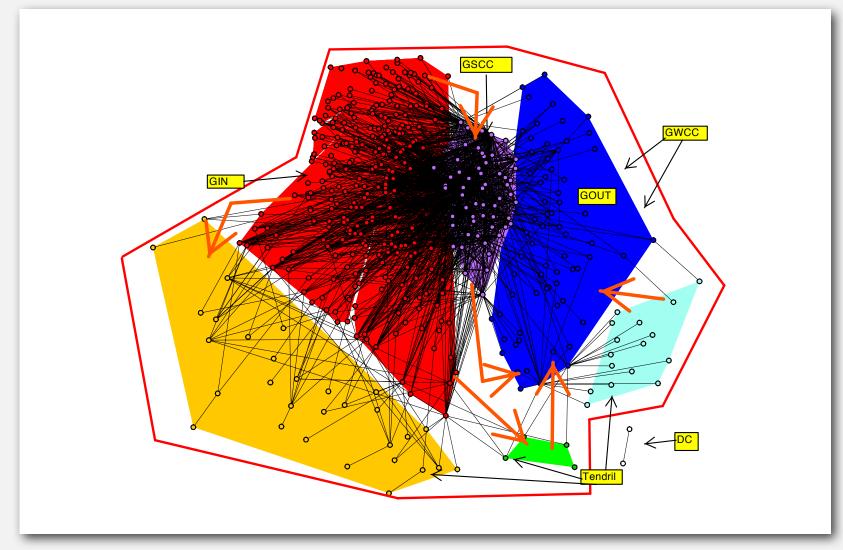

Vertex = political blog; edge = link.

The Political Blogosphere and the 2004 U.S. Election: Divided They Blog, Adamic and Glance, 2005

Overnight interbank loan graph

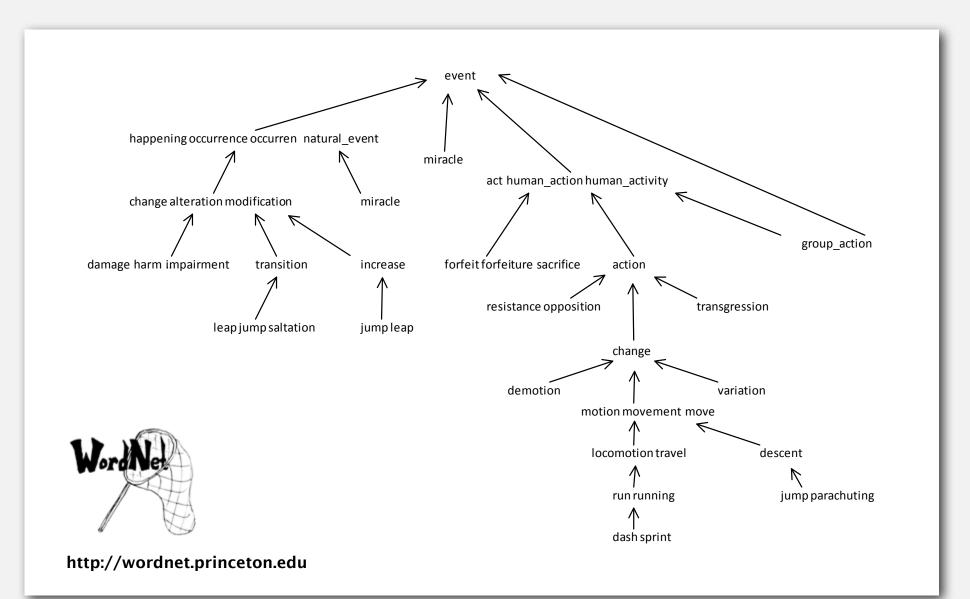

Vertex = bank; edge = overnight loan.

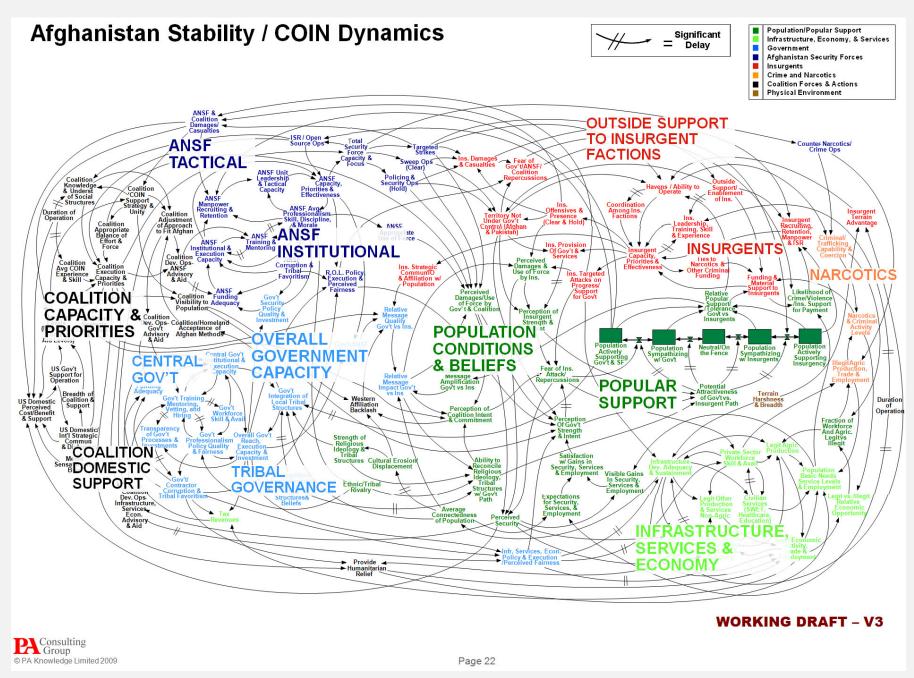

The Topology of the Federal Funds Market, Bech and Atalay, 2008

WordNet graph

Vertex = synset; edge = hypernym relationship.

The McChrystal Afghanistan PowerPoint slide

Digraph applications

digraph	vertex	directed edge
transportation	street intersection	one-way street
web	web page	hyperlink
food web	species	predator-prey relationship
WordNet	synset	hypernym
scheduling	task	precedence constraint
financial	bank	transaction
cell phone	person	placed call
infectious disease	person	infection
game	board position	legal move
citation	journal article	citation
object graph	object	pointer
inheritance hierarchy	class	inherits from
control flow	code block	jump

Path. Is there a directed path from s to t?

Shortest path. What is the shortest directed path from s to t?

Topological sort. Can you draw the digraph so that all edges point down?

Strong connectivity. Are all vertices mutually reachable?

Transitive closure. For which vertices v and w is there a path from v to w?

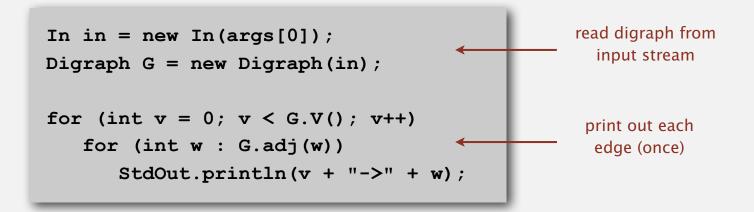

PageRank. What is the importance of a web page?

digraph API

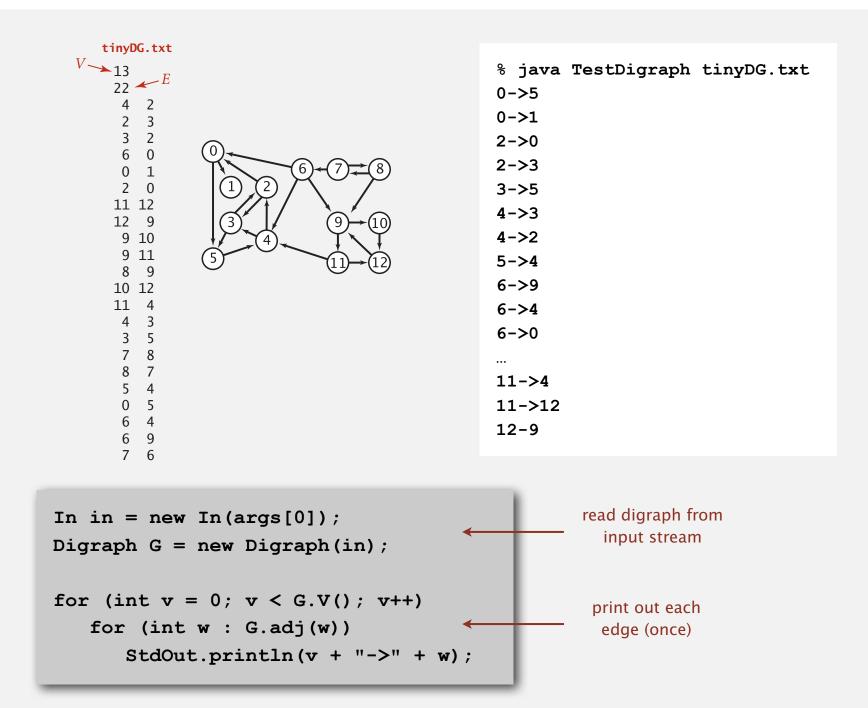

- digraph search
- topological sort
- strong components

Digraph API

public class	Digraph	
	Digraph(int V)	create an empty digraph with V vertices
	Digraph(In in)	create a digraph from input stream
void	<pre>addEdge(int v, int w)</pre>	add a directed edge $v \rightarrow w$
Iterable <integer></integer>	adj(int v)	vertices adjacent from v
int	V()	number of vertices
int	E()	number of edges
Digraph	reverse()	reverse of this digraph
String	toString()	string representation

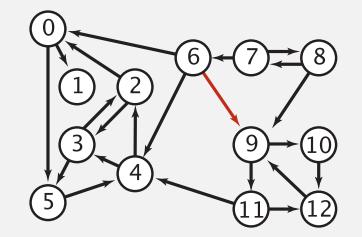

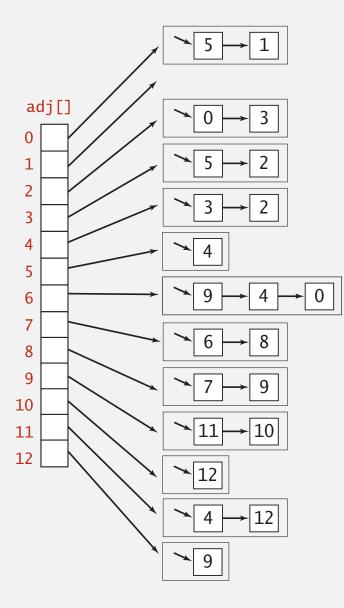

Digraph API

Adjacency-list digraph representation

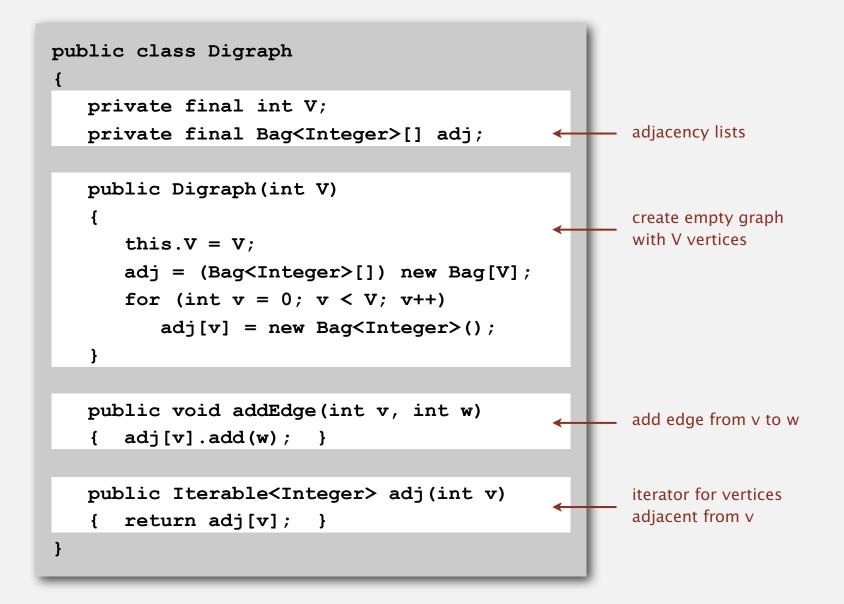

Maintain vertex-indexed array of lists (use Bag abstraction).

Adjacency-lists digraph representation: Java implementation

Same as Graph, but only insert one copy of each edge.

Digraph representations

In practice. Use adjacency-list representation.

- Algorithms based on iterating over vertices adjacent from v.
- Real-world digraphs tend to be sparse.

huge number of vertices, small average vertex degree

representation	space	insert edge from v to w	edge from v to w?	iterate over vertices adjacent from v?
list of edges	E	1	Е	E
adjacency matrix	V ²	1 †	1	V
adjacency list	E + V	1	outdegree(v)	outdegree(v)

† disallows parallel edges

digraph search

topological sort

strong components

Reachability

Problem. Find all vertices reachable from s along a directed path.

Depth-first search in digraphs

Same method as for undirected graphs.

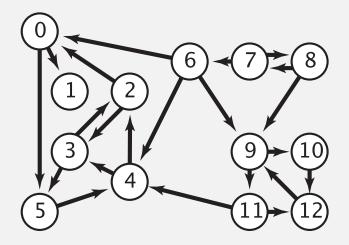

- Every undirected graph is a digraph (with edges in both directions).
- DFS is a digraph algorithm.

DFS (to visit a vertex v)

Mark v as visited.

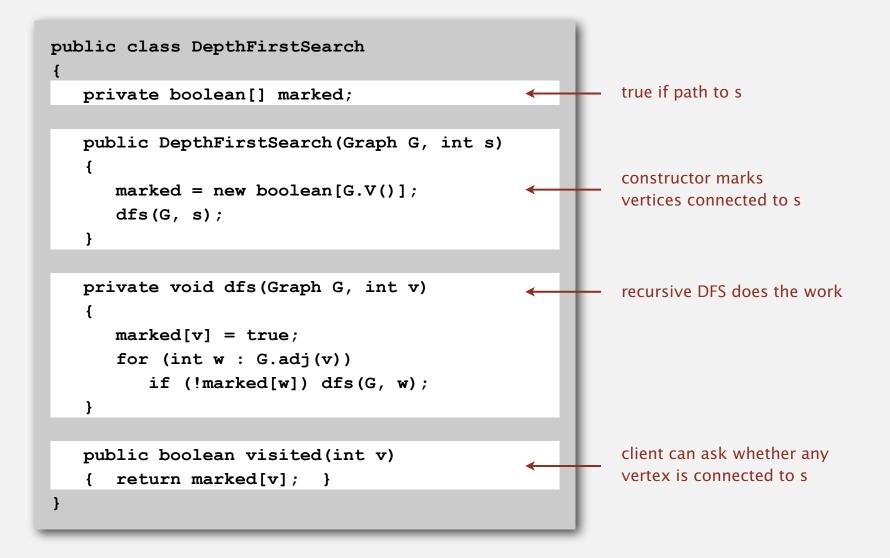

Recursively visit all unmarked

vertices w adjacent to v.

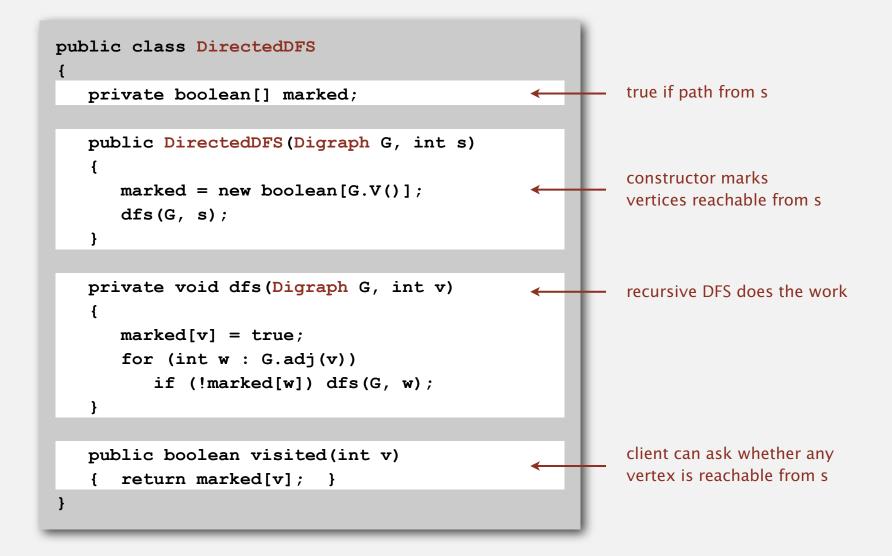

Depth-first search (in undirected graphs)

Recall code for undirected graphs.

Depth-first search (in directed graphs)

Digraph version identical to undirected one (substitute Digraph for Graph).

Reachability application: program control-flow analysis

Every program is a digraph.

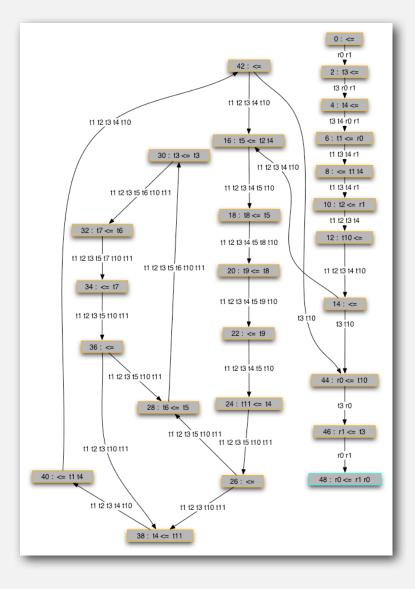

- Vertex = basic block of instructions (straight-line program).
- Edge = jump.

Dead-code elimination.

Find (and remove) unreachable code.

Infinite-loop detection.

Determine whether exit is unreachable.

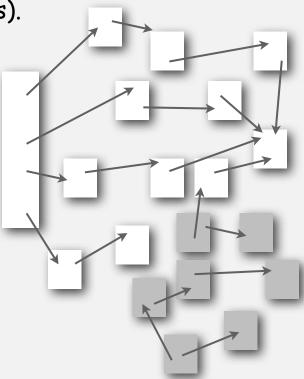

Every data structure is a digraph.

- Vertex = object.
- Edge = reference.

Roots. Objects known to be directly accessible by program (e.g., stack).

Reachable objects. Objects indirectly accessible by program (starting at a root and following a chain of pointers).

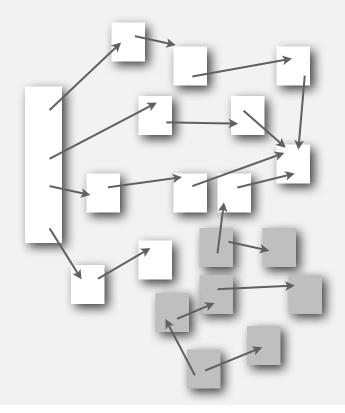

Reachability application: mark-sweep garbage collector

Mark-sweep algorithm. [McCarthy, 1960]

- Mark: mark all reachable objects.
- Sweep: if object is unmarked, it is garbage (so add to free list).

Memory cost. Uses 1 extra mark bit per object, plus DFS stack.

Depth-first search in digraphs summary

DFS enables direct solution of simple digraph problems.

- ✓ Reachability.
 - Path finding.
 - Topological sort.
 - Directed cycle detection.
 - Transitive closure.

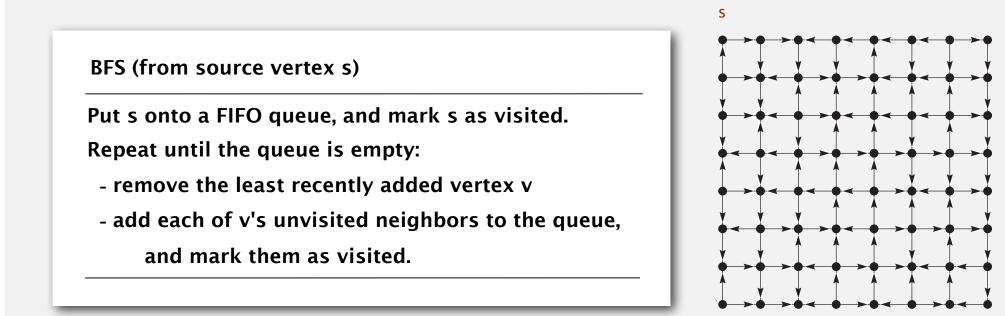

Basis for solving difficult digraph problems.

- Directed Euler path.
- Strongly-connected components.

Breadth-first search in digraphs

Same method as for undirected graphs.

- Every undirected graph is a digraph (with edges in both directions).
- BFS is a digraph algorithm.

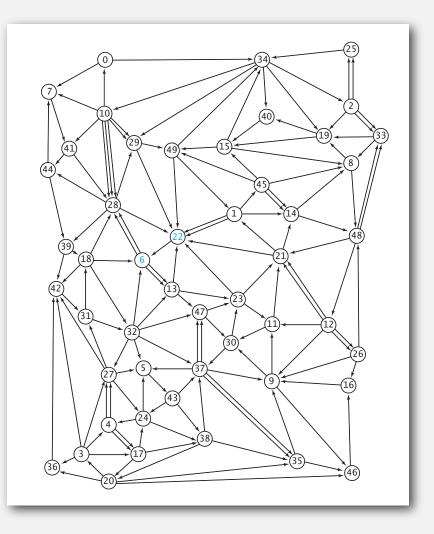

Proposition. BFS computes shortest paths (fewest number of edges).

Breadth-first search in digraphs application: web crawler

Goal. Crawl web, starting from some root web page, say www.princeton.edu. Solution. BFS with implicit graph.

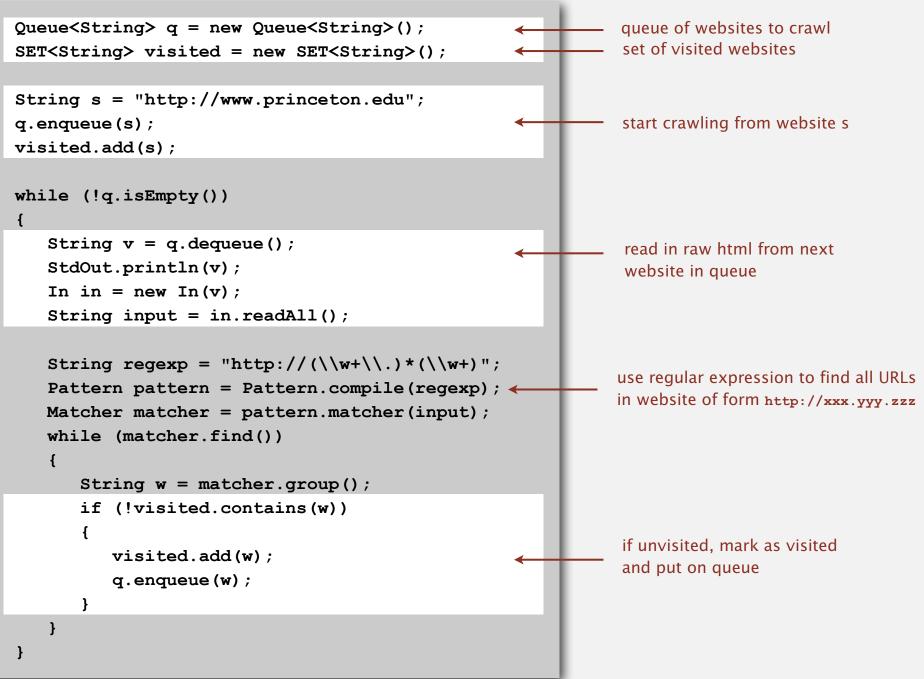

BFS.

- Choose root web page as source s.
- Maintain a Queue of websites to explore.
- Maintain a set of discovered websites.
- Dequeue the next website and enqueue websites to which it links (provided you haven't done so before).

Q. Why not use DFS?

Bare-bones web crawler: Java implementation

digraph API

digraph search

topological sort

strong components

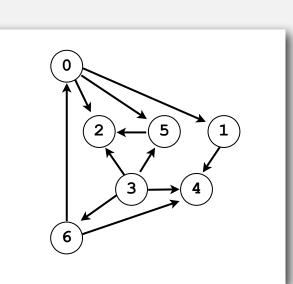

Precedence scheduling

Goal. Given a set of tasks to be completed with precedence constraints, in which order should we schedule the tasks?

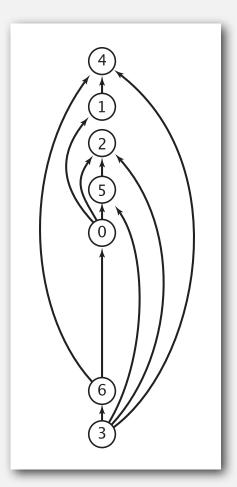

Graph model. vertex = task; edge = precedence constraint.

tasks

precedence constraint graph

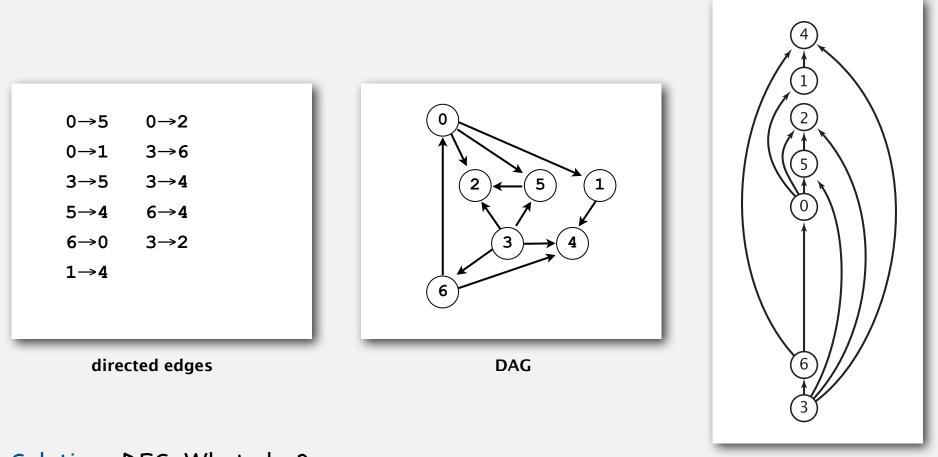

feasible schedule

Topological sort

DAG. Directed acyclic graph.

Topological sort. Redraw DAG so all edges point up.

Solution. DFS. What else?

topological order

Topological sort demo

Depth-first search order

```
public class DepthFirstOrder
Ł
   private boolean[] marked;
   private Stack<Integer> reversePost;
   public DepthFirstOrder(Digraph G)
      reversePost = new Stack<Integer>();
      marked = new boolean[G.V()];
      for (int v = 0; v < G.V(); v++)
         if (!marked[v]) dfs(G, v);
   }
   private void dfs(Digraph G, int v)
   {
      marked[v] = true;
      for (int w : G.adj(v))
         if (!marked[w]) dfs(G, w);
      reversePost.push(v);
   }
                                                       returns all vertices in
   public Iterable<Integer> reversePost()
                                                       "reverse DFS postorder"
   { return reversePost; }
```

reverse DFS postorder is a topological order!

Topological sort in a DAG: correctness proof

Proposition. Reverse DFS postorder of a DAG is a topological order. Pf. Consider any edge $v \rightarrow w$. When dfs(G, v) is called:

- Case 1: dfs(G, w) has already been called and returned. Thus, w was done before v.
- Case 2: dfs(G, w) has not yet been called. It will get called directly or indirectly by dfs(G, v) and will finish before dfs(G, v). Thus, w will be done before v.
- Case 3: dfs(G, w) has already been called, but has not returned.
 Can't happen in a DAG: function call stack contains path from w to v, so v→w would complete a cycle.

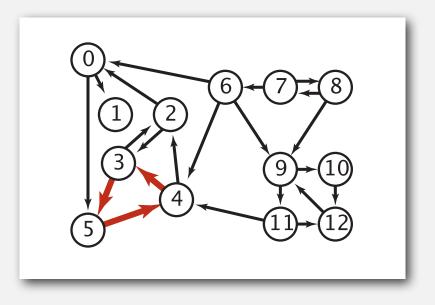

so they all appear after 3

Proposition. A digraph has a topological order iff no directed cycle. Pf.

- If directed cycle, topological order impossible.
- If no directed cycle, DFS-based algorithm finds a topological order.

Goal. Given a digraph, find a directed cycle.

Solution. DFS. What else? See textbook for full details.

Directed cycle detection application: precedence scheduling

Scheduling. Given a set of tasks to be completed with precedence constraints, in what order should we schedule the tasks?

PAGE	3			
DEPA	ARTMENT	COURSE	DESCRIPTION	PREREQS
	UTER INCE		INTERMEDIATE COMPILER DESIGN, WITH A FOCUS ON DEPENDENCY RESOLUTION.	CPSC 432
- Court			When the columnity project	

http://xkcd.com/754

Remark. A directed cycle implies scheduling problem is infeasible.

Directed cycle detection application: cyclic inheritance

The Java compiler does cycle detection.

```
public class A extends B
{
    ...
}
public class B extends C
{
    ...
}
```

```
public class C extends A
{
    ...
}
```

Directed cycle detection application: spreadsheet recalculation

Microsoft Excel does cycle detection (and has a circular reference toolbar!)

00	0	📄 Workbo	ok1						
\diamond	Α	В	С	D					
1	"=B1 + 1"	=C1 + 1	=A1 + 1						
2									
3									
4									
5									
6									
7		Microsoft Excel cannot calculate a formula.							
8		Cell references in the formula refer to the formula's result, creating a circular reference. Try one of the following: • If you accidentally created the circular reference, click OK. This will display the Circular Reference toolbar and help for using it to correct your formula. • To continue leaving the formula as it is, click Cancel.

12									
13									
14									
15									
16									
17									
18									
	She	et1 Sheet2 Sheet3							

Directed cycle detection application: symbolic links

The Linux file system does not do cycle detection.

% ln -s a.txt b.txt
% ln -s b.txt c.txt
% ln -s c.txt a.txt
% more a.txt
a.txt: Too many levels of symbolic links

topological sort

strong components

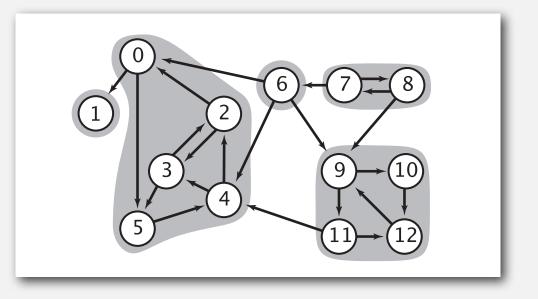

Strongly-connected components

Def. Vertices v and w are strongly connected if there is a directed path from v to w and a directed path from w to v.

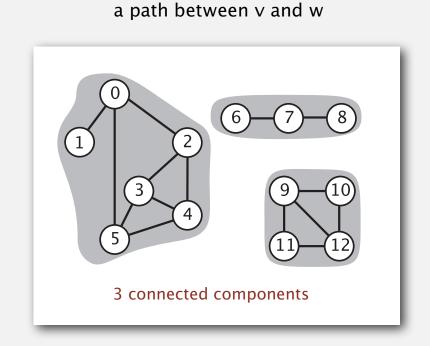

Key property. Strong connectivity is an equivalence relation:

- v is strongly connected to v.
- If v is strongly connected to w, then w is strongly connected to v.
- If v is strongly connected to w and w to x, then v is strongly connected to x.

Def. A strong component is a maximal subset of strongly-connected vertices.

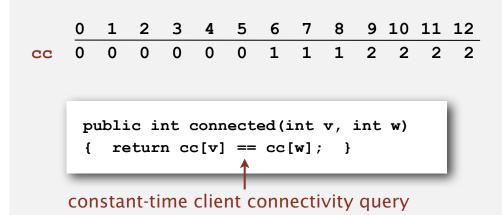

Connected components vs. strongly-connected components

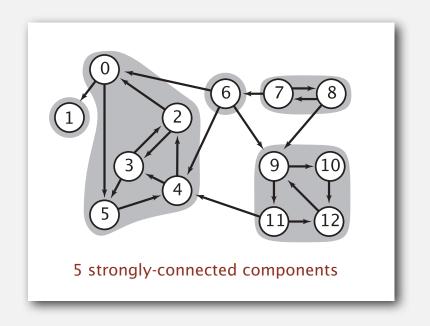

v and w are connected if there is

connected component id (easy to compute with DFS)

v and w are strongly connected if there is a directed path from v to w and a directed path from w to v

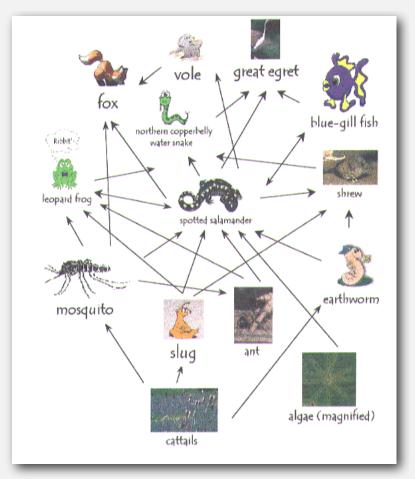

strongly-connected component id (how to compute?)

	0	1	2	3	4	5	6	7	8	9	10	11	12
scc	1	0	1	1	1	1	3	4	4	2	2	2	2
													10
<pre>public int stronglyConnected(int v, int w)</pre>													
1 }	<pre>{ return scc[v] == scc[w]; }</pre>												
constant-time client strong connectivity query													

Strong component application: ecological food webs

Food web graph. Vertex = species; edge = from producer to consumer.

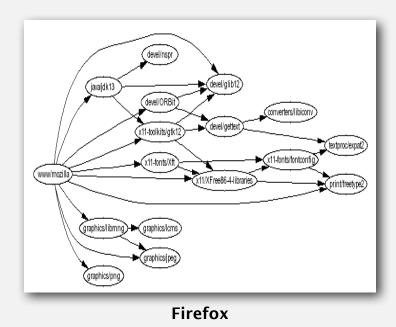

http://www.twingroves.district96.k12.il.us/Wetlands/Salamander/SalGraphics/salfoodweb.gif

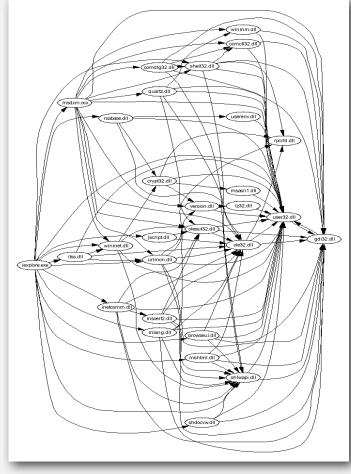

Strong component. Subset of species with common energy flow.

Strong component application: software modules

Software module dependency graph.

- Vertex = software module.
- Edge: from module to dependency.

Internet Explorer

Strong component. Subset of mutually interacting modules.

Approach 1. Package strong components together.

Approach 2. Use to improve design!

Strong components algorithms: brief history

1960s: Core OR problem.

- Widely studied; some practical algorithms.
- Complexity not understood.

1972: linear-time DFS algorithm (Tarjan).

- Classic algorithm.
- Level of difficulty: Algs4++.
- Demonstrated broad applicability and importance of DFS.

1980s: easy two-pass linear-time algorithm (Kosaraju).

- Forgot notes for lecture; developed algorithm in order to teach it!
- Later found in Russian scientific literature (1972).

1990s: more easy linear-time algorithms (Gabow, Mehlhorn).

- Gabow: fixed old OR algorithm.
- Cheriyan-Mehlhorn: needed one-pass algorithm for LEDA.

Kosaraju's algorithm: intuition

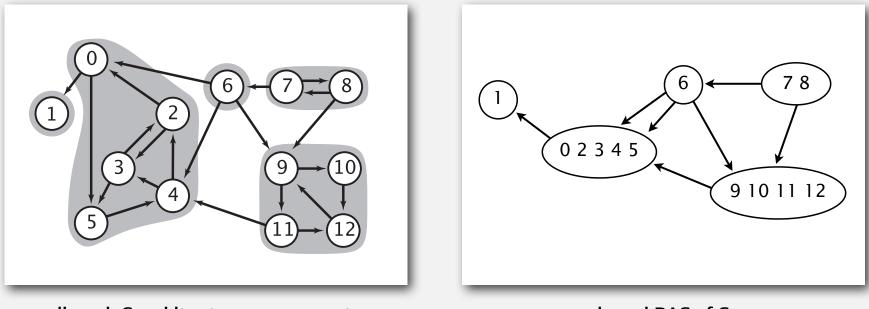

Reverse graph. Strong components in G are same as in G^R .

Kernel DAG. Contract each strong component into a single vertex.

Idea.

• Compute topological order in kernel DAG.

• Run DFS, considering vertices in reverse topological.

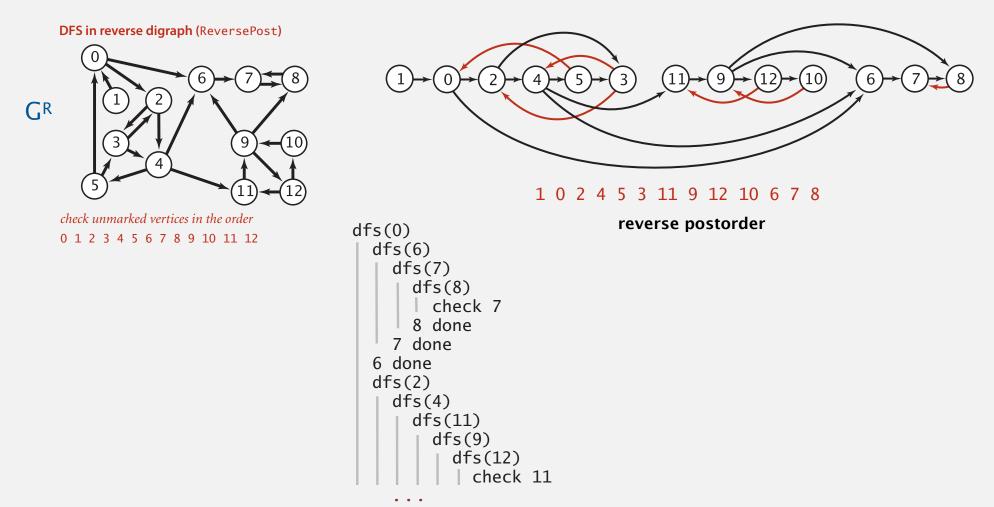

how to compute?

Kosaraju's algorithm

Simple (but mysterious) algorithm for computing strong components.

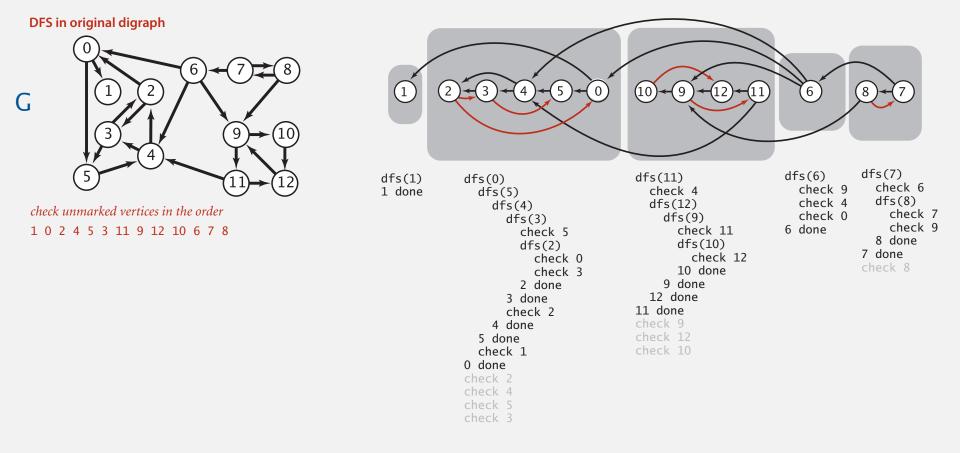

- Run DFS on G^R to compute reverse postorder.
- Run DFS on G, considering vertices in order given by first DFS.

Kosaraju's algorithm

Simple (but mysterious) algorithm for computing strong components.

- Run DFS on *G^R* to compute reverse postorder.
- Run DFS on G, considering vertices in order given by first DFS.

Proposition. Second DFS gives strong components. (!!)

Proposition. Kosaraju's algorithm computes strong components.

Pf. We show that the vertices marked during the constructor call $d_{fs}(G, s)$ are the vertices strongly connected to s.

 \leftarrow [If t is strongly connected to s, then t is marked during the call afs(G, s).]

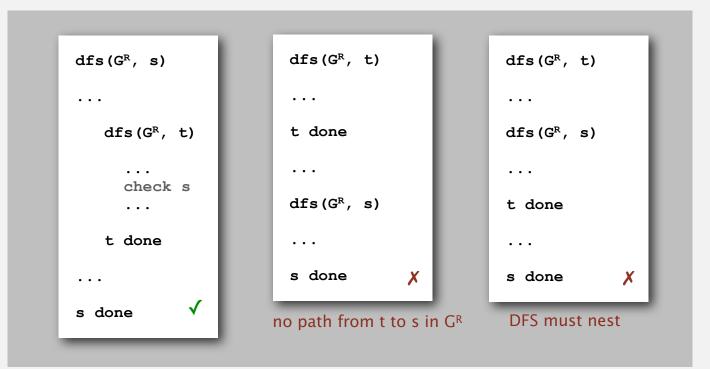

- There is a path from s to t, so t will be marked during afs(G, s) unless t was previously marked.
- There is a path from t to s, so if t were previously marked, then s would be marked before t finishes
 (so afs(G, s) would not have been called in constructor).

dfs(G, s)
dfs(G, t)
check s
t done
s done

Kosaraju proof of correctness (continued)

Proposition. Kosaraju's algorithm computes strong components.

- \Rightarrow [If t is marked during the call afs(G, s), then t is strongly connected to s.]
- Since t is marked during the call $a_{fs}(G, s)$, there is a path from s to t in G (or equivalently, a path from t to s in G^R).
- Reverse postorder construction implies that t is done before s in dfs of G^{R} .
- The only possibility for dfs in G^R implies there is a path from s to t in G^R. (or equivalently, from t to s in G).

Connected components in an undirected graph (with DFS)

```
public class CC
{
   private boolean marked[];
   private int[] id;
   private int count;
   public CC(Graph G)
   {
      marked = new boolean[G.V()];
      id = new int[G.V()];
      for (int v = 0; v < G.V(); v++)
      {
         if (!marked[v])
         {
            dfs(G, v);
            count++;
         }
      }
   }
   private void dfs(Graph G, int v)
   {
      marked[v] = true;
      id[v] = count;
      for (int w : G.adj(v))
         if (!marked[w])
            dfs(G, w);
   }
   public boolean connected(int v, int w)
   { return id[v] == id[w]; }
```

}

Strong components in a digraph (with two DFSs)

```
public class KosarajuSCC
{
   private boolean marked[];
   private int[] id;
   private int count;
   public KosarajuSCC(Digraph G)
   {
      marked = new boolean[G.V()];
      id = new int[G.V()];
      DepthFirstOrder dfs = new DepthFirstOrder(G.reverse());
      for (int v : dfs.reversePost())
      {
         if (!marked[v])
         {
            dfs(G, v);
            count++;
         }
      }
   }
   private void dfs(Digraph G, int v)
   {
      marked[v] = true;
      id[v] = count;
      for (int w : G.adj(v))
         if (!marked[w])
            dfs(G, w);
   }
   public boolean stronglyConnected(int v, int w)
   { return id[v] == id[w]; }
}
```

Digraph-processing summary: algorithms of the day
