

## Shortest paths in a weighted digraph

Given an edge-weighted digraph, find the shortest (directed) path from  $s$  to  $t$ .

5

## Shortest path variants

### Which vertices?

- Source-sink: from one vertex to another.
- Single source: from one vertex to every other.
- All pairs: between all pairs of vertices.

### Restrictions on edge weights?

- Nonnegative weights.
- Arbitrary weights.
- Euclidean weights.

### Cycles?

- No cycles.
- No "negative cycles."

**Simplifying assumption.** There exists a shortest path from  $s$  to each vertex  $v$ .

6

## Shortest path applications

- Map routing.
- Robot navigation.
- Texture mapping.
- Typesetting in TeX.
- Urban traffic planning.
- Optimal pipelining of VLSI chip.
- Telemarketer operator scheduling.
- Subroutine in advanced algorithms.
- Routing of telecommunications messages.
- Approximating piecewise linear functions.
- Network routing protocols (OSPF, BGP, RIP).
- Exploiting arbitrage opportunities in currency exchange.
- Optimal truck routing through given traffic congestion pattern.

8

## Weighted directed edge API

public class DirectedEdge	
DirectedEdge(int v, int w, double weight)	<i>weighted edge v→w</i>
int from()	<i>vertex v</i>
int to()	<i>vertex w</i>
double weight()	<i>weight of this edge</i>
String toString()	<i>string representation</i>

Idiom for processing an edge  $e$ : `int v = e.from(), w = e.to();`

9

## Weighted directed edge: implementation in Java

Similar to `Edge` for undirected graphs, but a bit simpler.

```
public class DirectedEdge
{
    private final int v, w;
    private final double weight;

    public DirectedEdge(int v, int w, double weight)
    {
        this.v = v;
        this.w = w;
        this.weight = weight;
    }

    public int from()
    { return v; }

    public int to()
    { return w; }

    public int weight()
    { return weight; }
}
```

`from()` and `to()` replace `either()` and `other()`

10

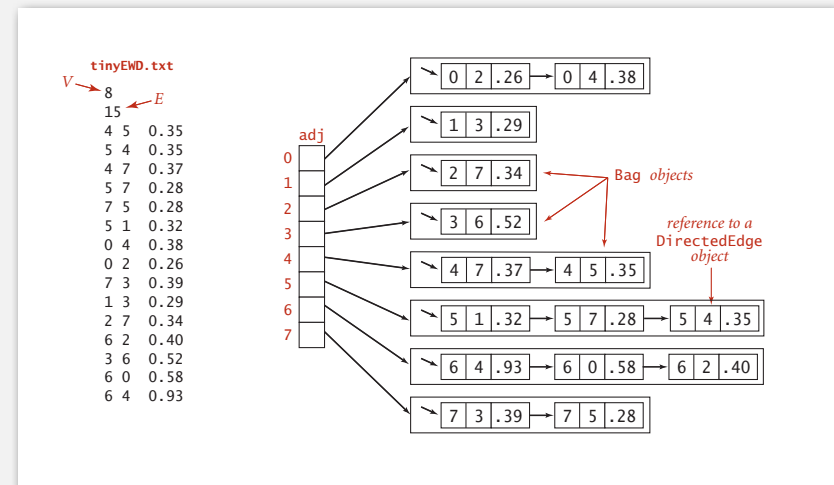

## Edge-weighted digraph API

public class EdgeWeightedDigraph	
EdgeWeightedDigraph(int V)	<i>edge-weighted digraph with V vertices</i>
EdgeWeightedDigraph(In in)	<i>edge-weighted digraph from input stream</i>
void addEdge(DirectedEdge e)	<i>add weighted directed edge e</i>
Iterable<DirectedEdge> adj(int v)	<i>edges adjacent from v</i>
int V()	<i>number of vertices</i>
int E()	<i>number of edges</i>
Iterable<DirectedEdge> edges()	<i>all edges in this digraph</i>
String toString()	<i>string representation</i>

Conventions. Allow self-loops and parallel edges.

11

## Edge-weighted digraph: adjacency-lists representation

12

Same as `EdgeWeightedGraph` except replace `Graph` with `Digraph`.

```
public class EdgeWeightedDigraph
{
    private final int V;
    private final Bag<Edge>[] adj;

    public EdgeWeightedDigraph(int V)
    {
        this.V = V;
        adj = (Bag<DirectedEdge>[]) new Bag[V];
        for (int v = 0; v < V; v++)
            adj[v] = new Bag<DirectedEdge>();
    }

    public void addEdge(DirectedEdge e)
    {
        int v = e.from();
        adj[v].add(e);
    }

    public Iterable<DirectedEdge> adj(int v)
    { return adj[v]; }
}
```

similar to edge-weighted undirected graph, but only add edge to v's adjacency list

13

Goal. Find the shortest path from  $s$  to every other vertex.

```
public class SP
{
    SP(EdgeWeightedDigraph G, int s)  shortest paths from s in graph G

    double distTo(int v)              length of shortest path from s to v

    Iterable<DirectedEdge> pathTo(int v)  shortest path from s to v

    boolean hasPathTo(int v)          is there a path from s to v?
}
```

```
SP sp = new SP(G, s);
for (int v = 0; v < G.V(); v++)
{
    StdOut.printf("%d to %d (%.2f): ", s, v, sp.distTo(v));
    for (DirectedEdge e : sp.pathTo(v))
        StdOut.print(e + " ");
    StdOut.println();
}
```

14

Goal. Find the shortest path from  $s$  to every other vertex.

```
public class SP
{
    SP(EdgeWeightedDigraph G, int s)  shortest paths from s in graph G

    double distTo(int v)              length of shortest path from s to v

    Iterable<DirectedEdge> pathTo(int v)  shortest path from s to v

    boolean hasPathTo(int v)          is there a path from s to v?
}
```

```

16

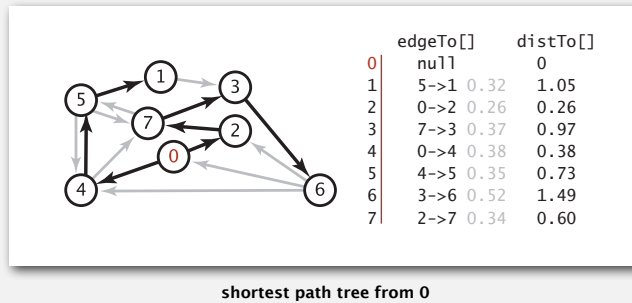

## Data structures for single-source shortest paths

**Goal.** Find the shortest path from  $s$  to every other vertex.

**Observation.** A **shortest path tree** (SPT) solution exists. Why?

**Consequence.** Can represent the SPT with two vertex-indexed arrays:

- $\text{distTo}[v]$  is length of shortest path from  $s$  to  $v$ .
- $\text{edgeTo}[v]$  is last edge on shortest path from  $s$  to  $v$ .

17

## Data structures for single-source shortest paths

**Goal.** Find the shortest path from  $s$  to every other vertex.

**Observation.** A **shortest path tree** (SPT) solution exists. Why?

**Consequence.** Can represent the SPT with two vertex-indexed arrays:

- $\text{distTo}[v]$  is length of shortest path from  $s$  to  $v$ .
- $\text{edgeTo}[v]$  is last edge on shortest path from  $s$  to  $v$ .

```
public double distTo(int v)
{ return distTo[v]; }

public Iterable<DirectedEdge> pathTo(int v)
{
    Stack<DirectedEdge> path = new Stack<DirectedEdge>();
    for (DirectedEdge e = edgeTo[v]; e != null; e = edgeTo[e.from()])
        path.push(e);
    return path;
}
```

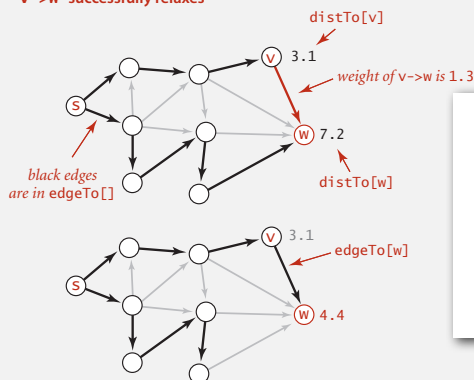

18

## Edge relaxation

**Relax edge**  $e = v \rightarrow w$ .

- $\text{distTo}[v]$  is length of shortest **known** path from  $s$  to  $v$ .
- $\text{distTo}[w]$  is length of shortest **known** path from  $s$  to  $w$ .
- $\text{edgeTo}[w]$  is last edge on shortest **known** path from  $s$  to  $w$ .
- If  $e = v \rightarrow w$  gives shorter path to  $w$  through  $v$ , update  $\text{distTo}[w]$  and  $\text{edgeTo}[w]$ .

$v \rightarrow w$  successfully relaxes

```
private void relax(DirectedEdge e)
{
    int v = e.from(), w = e.to();
    if (distTo[w] > distTo[v] + e.weight())
    {
        distTo[w] = distTo[v] + e.weight();
        edgeTo[w] = e;
    }
}
```

19

## Shortest-paths optimality conditions

**Proposition.** Let  $G$  be an edge-weighted digraph.

Then  $\text{distTo}[]$  are the shortest path distances from  $s$  iff:

- For each vertex  $v$ ,  $\text{distTo}[v]$  is the length of some path from  $s$  to  $v$ .
- For each edge  $e = v \rightarrow w$ ,  $\text{distTo}[w] \leq \text{distTo}[v] + e.\text{weight}()$ .

**Pf.**  $\Leftarrow$  [ necessary ]

- Suppose that  $\text{distTo}[w] > \text{distTo}[v] + e.\text{weight}()$  for some edge  $e = v \rightarrow w$ .
- Then,  $e$  gives a path from  $s$  to  $w$  (through  $v$ ) of length less than  $\text{distTo}[w]$ .

20

## Shortest-paths optimality conditions

**Proposition.** Let  $G$  be an edge-weighted digraph.

Then  $\text{distTo}[\cdot]$  are the shortest path distances from  $s$  iff:

- For each vertex  $v$ ,  $\text{distTo}[v]$  is the length of some path from  $s$  to  $v$ .
- For each edge  $e = v \rightarrow w$ ,  $\text{distTo}[w] \leq \text{distTo}[v] + e.\text{weight}()$ .

**Pf.**  $\Rightarrow$  [sufficient]

- Suppose that  $s = v_0 \rightarrow v_1 \rightarrow v_2 \rightarrow \dots \rightarrow v_k = w$  is a shortest path from  $s$  to  $w$ .

- Then,
 
$$\begin{aligned} \text{distTo}[v_k] &\leq \text{distTo}[v_{k-1}] + e_k.\text{weight}() \\ \text{distTo}[v_{k-1}] &\leq \text{distTo}[v_{k-2}] + e_{k-1}.\text{weight}() \\ &\dots \\ \text{distTo}[v_1] &\leq \text{distTo}[v_0] + e_1.\text{weight}() \end{aligned}$$

- Collapsing these inequalities and eliminate  $\text{distTo}[v_0] = \text{distTo}[s] = 0$ :

$$\text{distTo}[w] = \text{distTo}[v_k] \leq \underbrace{e_k.\text{weight}() + e_{k-1}.\text{weight}() + \dots + e_1.\text{weight}()}_{\text{weight of shortest path from } s \text{ to } w}$$

weight of some path from  $s$  to  $w$

- Thus,  $\text{distTo}[w]$  is the weight of shortest path to  $w$ . ■

21

## Generic shortest-paths algorithm

**Generic algorithm (to compute SPT from  $s$ )**

Initialize  $\text{distTo}[s] = 0$  and  $\text{distTo}[v] = \infty$  for all other vertices.

Repeat until optimality conditions are satisfied:

- Relax any edge.

**Efficient implementations.** How to choose which edge to relax?

Ex 1. Dijkstra's algorithm (nonnegative weights).

Ex 2. Topological sort algorithm (no directed cycles).

Ex 3. Bellman-Ford algorithm (no negative cycles).

23

## Generic shortest-paths algorithm

**Generic algorithm (to compute SPT from  $s$ )**

Initialize  $\text{distTo}[s] = 0$  and  $\text{distTo}[v] = \infty$  for all other vertices.

Repeat until optimality conditions are satisfied:

- Relax any edge.

**Proposition.** Generic algorithm computes SPT from  $s$ . ← assuming SPT exists

**Pf sketch.**

- Throughout algorithm,  $\text{distTo}[v]$  is the length of a simple path from  $s$  to  $v$  and  $\text{edgeTo}[v]$  is last edge on path.
- Each successful relaxation decreases  $\text{distTo}[v]$  for some  $v$ .
- The entry  $\text{distTo}[v]$  can decrease at most a finite number of times. ■

*“ Do only what only you can do. ”*

*“ In their capacity as a tool, computers will be but a ripple on the surface of our culture. In their capacity as intellectual challenge, they are without precedent in the cultural history of mankind. ”*

*“ The use of COBOL cripples the mind; its teaching should, therefore, be regarded as a criminal offence. ”*

*“ It is practically impossible to teach good programming to students that have had a prior exposure to BASIC: as potential programmers they are mentally mutilated beyond hope of regeneration. ”*

*“ APL is a mistake, carried through to perfection. It is the language of the future for the programming techniques of the past: it creates a new generation of coding bums. ”*

Edsger W. Dijkstra  
Turing award 1972

### Dijkstra's algorithm

- Consider vertices in increasing order of distance from  $s$  (non-tree vertex with the lowest `distTo[]` value).
- Add vertex to tree and relax all edges incident from that vertex.

```
4->5 0.35
5->4 0.35
4->7 0.37
5->7 0.28
7->5 0.28
5->1 0.32
0->4 0.38
0->2 0.26
7->3 0.39
1->3 0.29
2->7 0.34
6->2 0.40
3->6 0.52
6->0 0.58
6->4 0.93
```

v	distTo[v]	edgeTo[v]
0	0.00	-
1		
2		
3		
4		
5		
6		
7		

### Dijkstra's algorithm visualization

- Add vertex to tree and relax all edges incident from that vertex.

25%

50%

100%

30

## Dijkstra's algorithm: correctness proof

**Proposition.** Dijkstra's algorithm computes SPT in any edge-weighted digraph with nonnegative weights.

**Pf.**

- Each edge  $e = v \rightarrow w$  is relaxed exactly once (when  $v$  is relaxed), leaving  $\text{distTo}[w] \leq \text{distTo}[v] + e.\text{weight}()$ .
- Inequality holds until algorithm terminates because:
  - $\text{distTo}[w]$  cannot increase  $\leftarrow \text{distTo}[]$  values are monotone decreasing
  - $\text{distTo}[v]$  will not change  $\leftarrow$  edge weights are nonnegative and we choose lowest  $\text{distTo}[]$  value at each step
- Thus, upon termination, shortest-paths optimality conditions hold. ■

31

## Dijkstra's algorithm: Java implementation

```
public class DijkstraSP
{
    private DirectedEdge[] edgeTo;
    private double[] distTo;
    private IndexMinPQ<Double> pq;

    public DijkstraSP(EdgeWeightedDigraph G, int s)
    {
        edgeTo = new DirectedEdge[G.V()];
        distTo = new double[G.V()];
        pq = new IndexMinPQ<Double>(G.V());

        for (int v = 0; v < G.V(); v++)
            distTo[v] = Double.POSITIVE_INFINITY;
        distTo[s] = 0.0;

        pq.insert(s, 0.0);
        while (!pq.isEmpty())
        {
            int v = pq.delMin();
            for (DirectedEdge e : G.adj(v))
                relax(e);
        }
    }
}
```

$\leftarrow$  relax vertices in order of distance from  $s$

32

```
private void relax(DirectedEdge e)
{
    int v = e.from(), w = e.to();
    if (distTo[w] > distTo[v] + e.weight())
    {
        distTo[w] = distTo[v] + e.weight();
        edgeTo[w] = e;
        if (pq.contains(w)) pq.decreaseKey(w, distTo[w]);
        else pq.insert(w, distTo[w]);
    }
}
```

← update PQ

Depends on PQ implementation:  $V$  insert,  $V$  delete-min,  $E$  decrease-key.

PQ implementation	insert	delete-min	decrease-key	total
array	1	$V$	1	$V^2$
binary heap	$\log V$	$\log V$	$\log V$	$E \log V$
d-way heap (Johnson 1975)	$d \log_d V$	$d \log_d V$	$\log_d V$	$E \log_{E/V} V$
Fibonacci heap (Fredman-Tarjan 1984)	$1^\dagger$	$\log V^\dagger$	$1^\dagger$	$E + V \log V$

<sup>†</sup> amortized

Bottom line.

- Array implementation optimal for dense graphs.
- Binary heap much faster for sparse graphs.
- d-way heap worth the trouble in performance-critical situations.
- Fibonacci heap best in theory, but not worth implementing.

Priority-first search

**Insight.** Four of our graph-search methods are the same algorithm!

- Maintain a set of explored vertices  $S$ .
- Grow  $S$  by exploring edges with exactly one endpoint leaving  $S$ .

**DFS.** Take edge from vertex which was discovered most recently.

**BFS.** Take edge from vertex which was discovered least recently.

**Prim.** Take edge of minimum weight.

**Dijkstra.** Take edge to vertex that is closest to  $S$ .

**Challenge.** Express this insight in reusable Java code.

- edge-weighted digraph API

- Dijkstra's algorithm
- edge-weighted DAGs
- negative weights

## Acyclic edge-weighted digraphs

Q. Suppose that an edge-weighted digraph has no directed cycles. Is it easier to find shortest paths than in a general digraph?

A. Yes!

```

5->4 0.35
4->7 0.37
5->7 0.28
5->1 0.32
4->0 0.38
0->2 0.26
3->7 0.39
1->3 0.29
7->2 0.34
6->2 0.40
3->6 0.52
6->0 0.58
6->4 0.93
    
```

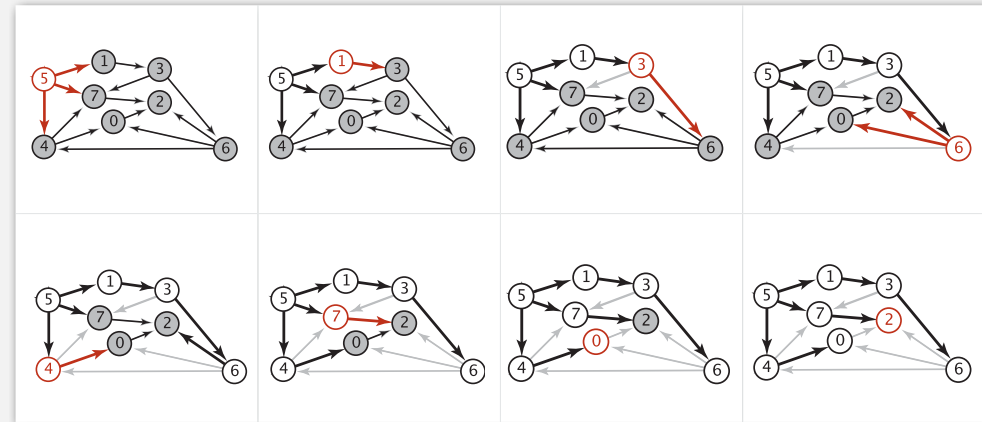

37

## Shortest paths in edge-weighted DAGs

### Topological sort algorithm.

- Consider vertices in topologically order.
- Relax all edges incident from vertex.

topological order: 5 1 3 6 4 7 0 2

38

## Shortest paths in edge-weighted DAGs

```

public class AcyclicSP
{
    private DirectedEdge[] edgeTo;
    private double[] distTo;

    public AcyclicSP(EdgeWeightedDigraph G, int s)
    {
        edgeTo = new DirectedEdge[G.V()];
        distTo = new double[G.V()];

        for (int v = 0; v < G.V(); v++)
            distTo[v] = Double.POSITIVE_INFINITY;
        distTo[s] = 0.0;

        Topological topological = new Topological(G);
        for (int v : topological.order())
            for (DirectedEdge e : G.adj(v))
                relax(e);
    }
}
    
```

← topological order

39

## Shortest paths in edge-weighted DAGs

### Topological sort algorithm.

- Consider vertices in topologically order.
- Relax all edges incident from vertex.

**Proposition.** Topological sort algorithm computes SPT in any edge-weighted DAG in time proportional to  $E + V$ .

### Pf.

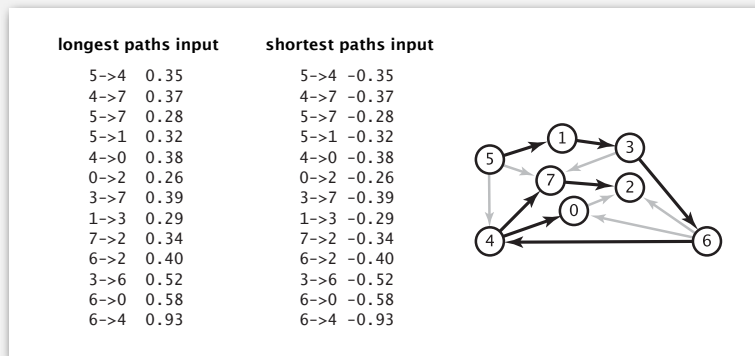

- Each edge  $e = v \rightarrow w$  is relaxed exactly once (when  $v$  is relaxed), leaving  $\text{distTo}[w] \leq \text{distTo}[v] + e.\text{weight}()$ .
- Inequality holds until algorithm terminates because:
  - $\text{distTo}[w]$  cannot increase ←  $\text{distTo}[]$  values are monotone decreasing
  - $\text{distTo}[v]$  will not change ← because of topological order, no edge pointing to  $v$  will be relaxed after  $v$  is relaxed
- Thus, upon termination, shortest-paths optimality conditions hold. ■

40

## Longest paths in edge-weighted DAGs

Formulate as a shortest paths problem in edge-weighted DAGs.

- Negate all weights.
  - Find shortest paths.
  - Negate weights in result.
- equivalent: reverse sense of equality in  $\text{relax}()$

**Key point.** Topological sort algorithm works even with negative edge weights.

41

## Longest paths in edge-weighted DAGs: application

**Parallel job scheduling.** Given a set of jobs with durations and precedence constraints, schedule the jobs (by finding a start time for each) so as to achieve the minimum completion time while respecting the constraints.

job	duration	must complete before
0	41.0	1 7 9
1	51.0	2
2	50.0	
3	36.0	
4	38.0	
5	45.0	
6	21.0	3 8
7	32.0	3 8
8	32.0	2
9	29.0	4 6

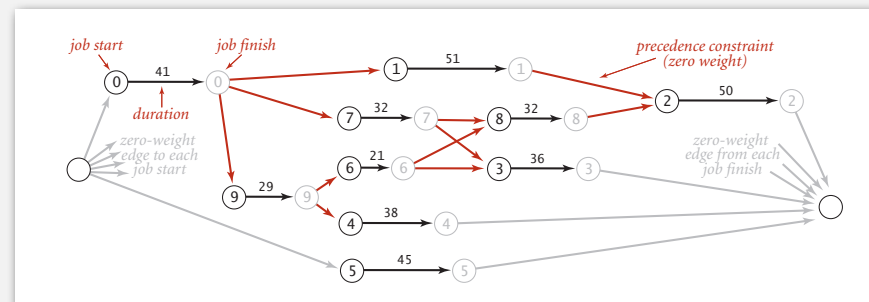

42

## Critical path method

**CPM.** To solve a parallel job-scheduling problem, create acyclic edge-weighted digraph:

- Source and sink vertices.
- Two vertices (begin and end) for each job.
- Three edges for each job.
  - begin to end (weighted by duration)
  - source to begin (0 weight)
  - end to sink (0 weight)

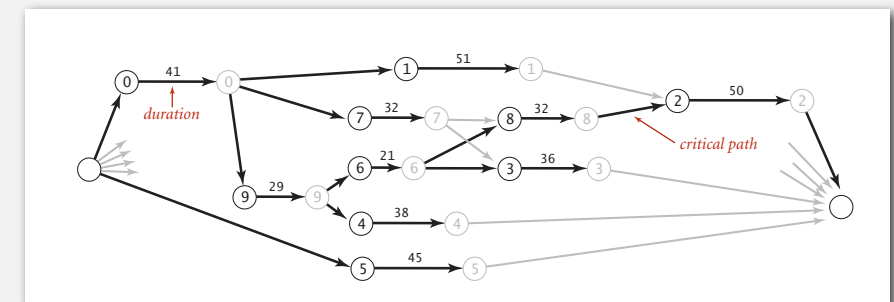

job	duration	must complete before
0	41.0	1 7 9
1	51.0	2
2	50.0	
3	36.0	
4	38.0	
5	45.0	
6	21.0	3 8
7	32.0	3 8
8	32.0	2
9	29.0	4 6

43

## Critical path method

**CPM.** Use longest path from the source to schedule each job.

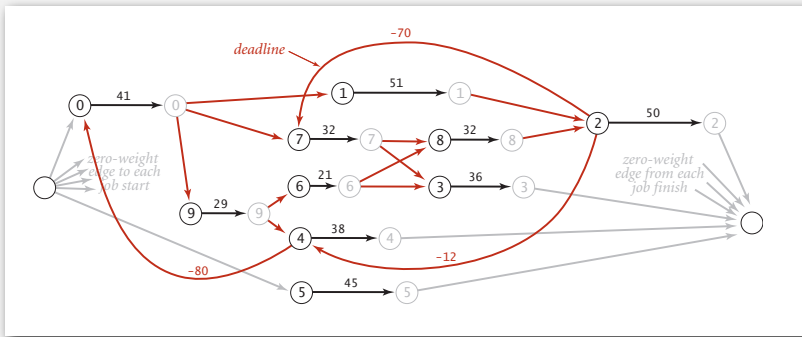

44

## Deep water

**Deadlines.** Add extra constraints to the parallel job-scheduling problem.

Ex. "Job 2 must start no later than 12 time units after job 4 starts."

**Consequences.**

- Corresponding shortest-paths problem has cycles (and negative weights).
- Possibility of infeasible problem (negative cycles).

45

- ▶ edge-weighted digraph API
- ▶ shortest-paths properties
- ▶ Dijkstra's algorithm
- ▶ edge-weighted DAGs
- ▶ **negative weights**

46

## Shortest paths with negative weights: failed attempts

**Dijkstra.** Doesn't work with negative edge weights.

Dijkstra selects vertex 3 immediately after 0.  
But shortest path from 0 to 3 is  $0 \rightarrow 1 \rightarrow 2 \rightarrow 3$ .

**Re-weighting.** Add a constant to every edge weight doesn't work.

Adding 9 to each edge weight changes the shortest path from  $0 \rightarrow 1 \rightarrow 2 \rightarrow 3$  to  $0 \rightarrow 3$ .

**Bad news.** Need a different algorithm.

47

## Negative cycles

**Def.** A **negative cycle** is a directed cycle whose sum of edge weights is negative.

**Proposition.** A SPT exists iff no negative cycles.

assuming all vertices reachable from s

48

## Shortest paths with negative weights: dynamic programming algorithm

### Dynamic programming algorithm

Initialize  $\text{distTo}[s] = 0$  and  $\text{distTo}[v] = \infty$  for all other vertices.

Repeat  $V$  times:

- Relax each edge.

```
for (int i = 1; i <= G.V(); i++)
  for (int v = 0; v < G.V(); v++)
    for (DirectedEdge e : G.adj(v))
      relax(e);
```

← phase  $i$  (relax each edge)

**Proposition.** Dynamic programming algorithm computes SPT in any edge-weighted digraph with no negative cycles in time proportional to  $E \times V$ .

**Pf idea.** After phase  $i$ , found shortest path containing at most  $i$  edges.

49

## Bellman-Ford algorithm

**Observation.** If  $\text{distTo}[v]$  does not change during phase  $i$ , no need to relax any edge incident from  $v$  in phase  $i+1$ .

**FIFO implementation.** Maintain **queue** of vertices whose  $\text{distTo}[]$  changed.

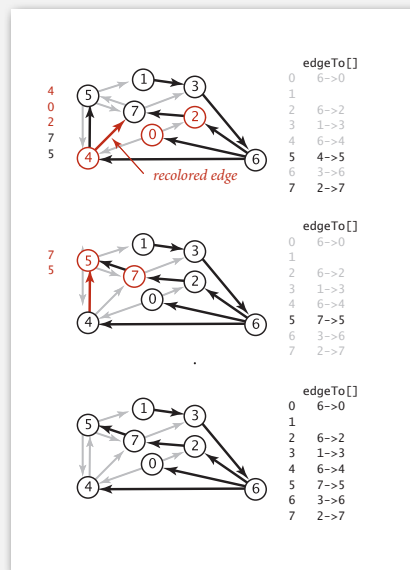

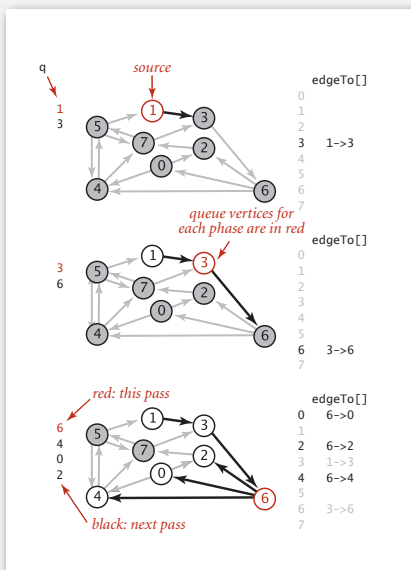

↑  
be careful to keep at most one copy of each vertex on queue (why?)

**Overall effect.**

- The running time is still proportional to  $E \times V$  in worst case.
- But much faster than that in practice.

50

## Bellman-Ford algorithm trace

51

## Bellman-Ford algorithm

```
public class BellmanFordSP
{
  private double[] distTo;
  private DirectedEdge[] edgeTo;
  private int[] onQ;
  private Queue<Integer> queue;

  public BellmanFordSPT(EdgeWeightedDigraph G, int s)
  {
    distTo = new double[G.V()];
    edgeTo = new DirectedEdge[G.V()];
    onQ = new int[G.V()];
    queue = new Queue<Integer>();

    for (int v = 0; v < V; v++)
      distTo[v] = Double.POSITIVE_INFINITY;
    distTo[s] = 0.0;

    queue.enqueue(s);
    while (!queue.isEmpty())
    {
      int v = queue.dequeue();
      onQ[v] = false;
      for (DirectedEdge e : G.adj(v))
        relax(e);
    }
  }

  private void relax(DirectedEdge e)
  {
    int v = e.from(), w = e.to();
    if (distTo[w] > distTo[v] + e.weight())
    {
      distTo[w] = distTo[v] + e.weight();
      edgeTo[w] = e;
      if (!onQ[w])
      {
        q.enqueue(w);
        onQ[w] = true;
      }
    }
  }
}
```

← queue of vertices whose  $\text{distTo}[]$  value changes

52

## Bellman-Ford algorithm visualization

53

## Single source shortest-paths implementation: cost summary

algorithm	restriction	typical case	worst case	extra space
topological sort	no directed cycles	$E + V$	$E + V$	$V$
Dijkstra (binary heap)	no negative weights	$E \log V$	$E \log V$	$V$
dynamic programming	no negative cycles	$E V$	$E V$	$V$
Bellman-Ford		$E + V$	$E V$	$V$

**Remark 1.** Directed cycles make the problem harder.

**Remark 2.** Negative weights make the problem harder.

**Remark 3.** Negative cycles makes the problem intractable.

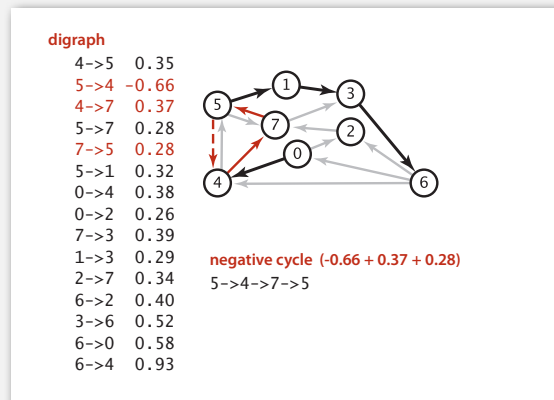

54

## Finding a negative cycle

**Negative cycle.** Add two method to the API for `SP`.

```

boolean hasNegativeCycle ()    is there a negative cycle?
Iterable <DirectedEdge> negativeCycle ()    negative cycle reachable from s
    
```

55

## Finding a negative cycle

**Observation.** If there is a negative cycle, Bellman-Ford gets stuck in loop, updating `distTo[]` and `edgeTo[]` entries of vertices in the cycle.

**Proposition.** If any vertex  $v$  is updated in phase  $V$ , there exists a negative cycle (and can trace back `edgeTo[v]` entries to find it).

**In practice.** Check for negative cycles more frequently.

56

## Negative cycle application: arbitrage detection

**Problem.** Given table of exchange rates, is there an arbitrage opportunity?

	USD	EUR	GBP	CHF	CAD
USD	1	0.741	0.657	1.061	1.011
EUR	1.350	1	0.888	1.433	1.366
GBP	1.521	1.126	1	1.614	1.538
CHF	0.943	0.698	0.620	1	0.953
CAD	0.995	0.732	0.650	1.049	1

Ex. \$1,000  $\Rightarrow$  741 Euros  $\Rightarrow$  1,012.206 Canadian dollars  $\Rightarrow$  \$1,007.14497.

$$1000 \times 0.741 \times 1.366 \times 0.995 = 1007.14497$$

57

## Negative cycle application: arbitrage detection

**Currency exchange graph.**

- Vertex = currency.
- Edge = transaction, with weight equal to exchange rate.
- Find a directed cycle whose product of edge weights is  $> 1$ .

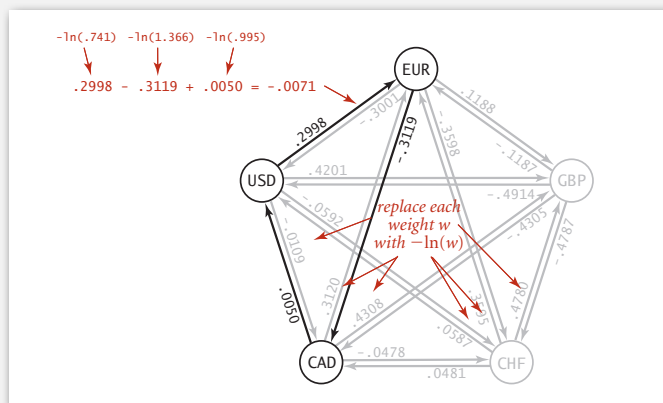

**Challenge.** Express as a negative cycle detection problem.

58

## Negative cycle application: arbitrage detection

**Model as a negative cycle detection problem by taking logs.**

- Let weight of edge  $v \rightarrow w$  be  $-\ln(\text{exchange rate from currency } v \text{ to } w)$ .
- Multiplication turns to addition;  $> 1$  turns to  $< 0$ .
- Find a directed cycle whose sum of edge weights is  $< 0$  (negative cycle).

**Remark.** Fastest algorithm is extraordinarily valuable!

59

## Shortest paths summary

**Dijkstra's algorithm.**

- Nearly linear-time when weights are nonnegative.
- Generalization encompasses DFS, BFS, and Prim.

**Acyclic edge-weighted digraphs.**

- Arise in applications.
- Faster than Dijkstra's algorithm.
- Negative weights are no problem.

**Negative weights and negative cycles.**

- Arise in applications.
- If no negative cycles, can find shortest paths via Bellman-Ford.
- If negative cycles, can find one via Bellman-Ford.

**Shortest-paths is a broadly useful problem-solving model.**
