

More Proofs By Induction (Trees and General Datatypes)

COS 326

David Walker

Princeton University

notes: <http://www.cs.princeton.edu/courses/archive/fall15/cos326/notes/reasoning-data.php>

Final Exam Schedule Announced

COS 326: ~~July~~ Jan 26, 7:30pm

McCosh 46

Be there or be square.

Exam Topics

In general:

- Anything from the lectures, lecture notes, precepts, assignments
- Precept exercises are a good way to study
- As are past midterms (see Piazza)

Functional programming

- lists, data types, higher-order and polymorphic functions
- map, fold, programming with combinators
- good properties of OCaml

Substitution model, space model, cps, closures, interpreters

Equivalence of programs, proofs by induction

PROOFS ABOUT DATATYPES

Template for Inductive Proofs on Lists

Theorem: For all lists xs , $\text{property}(xs)$.

Proof: By induction on lists xs .

Case: $xs == []$:

... no uses of IH ...

Case: $xs == \text{hd} :: \text{tl}$:

IH: $\text{property}(\text{tl})$

Template for Inductive Proofs on Lists

Theorem: For all lists xs , $\text{property}(xs)$.

Proof: By induction on lists xs .

Case: $xs == []$:

... no uses of IH ...

one case for empty list

Case: $xs == \text{hd} :: \text{tl}$:

IH: $\text{property}(\text{tl})$

one case for non-empty lists

IH may be used on smaller lists

In general, cases must cover all the lists:

- other possibilities: case for $[]$, case for $x1 :: []$, case for $x1 :: x2 :: \text{tl}$

Template for Inductive Proofs on Lists

Theorem: For all lists xs , $\text{property}(xs)$.

Proof: By induction on lists xs .

Case: $xs == []$:

... no uses of IH ...

one case for empty list

Case: $xs == \text{hd} :: \text{tl}$:

IH: $\text{property}(\text{tl})$

one case for non-empty lists

IH may be used on smaller lists

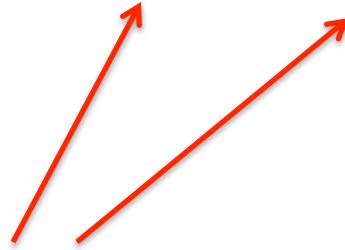

In general, cases must cover all the lists:

- other possibilities: case for $[]$, case for $x1 :: []$, case for $x1 :: x2 :: \text{tl}$

just splitting the case for non-empty lists in 2 again

More General Template for Inductive Datatypes

```
type t = C1 of t1 | C2 of t2 | ... | Cn of tn
```

types $t_1, t_2 \dots t_n$, may contain 1 or more occurrence of t within them.

Examples:

```
type mylist =
  MyNil
  | MyCons of int * mylist
```

```
type 'a tree =
  Leaf
  | Node of 'a * 'a tree * 'a tree
```

recursive occurrences

More General Template for Inductive Datatypes

```
type t = C1 of t1 | C2 of t2 | ... | Cn of tn
```

Theorem: For all $x : t$, $\text{property}(x)$.

Proof: By induction on structure of values x with type t .

More General Template for Inductive Datatypes

```
type t = C1 of t1 | C2 of t2 | ... | Cn of tn
```

Theorem: For all $x : t$, $\text{property}(x)$.

Proof: By induction on structure of values x with type t .

Case: $x == C1 v$:

... use IH on components of v that have type t ...

Case: $x == C2 v$:

... use IH on components of v that have type t ...

Case: $x == Cn v$:

... use IH on components of v that have type t ...

A PROOF ABOUT TREES

Another example

```
type 'a tree = Leaf | Node of 'a * 'a tree * 'a tree
```

```
let rec tm f t =
  match t with
  | Leaf -> Leaf
  | Node (x, l, r) -> Node (f x, tm f l, tm f r)
```

```
let (<>) f g =
  fun x -> f (g x)
```

Another example

```
type 'a tree = Leaf | Node of 'a * 'a tree * 'a tree
```

```
let rec tm f t =
  match t with
  | Leaf -> Leaf
  | Node (x, l, r) -> Node (f x, tm f l, tm f r)
```

```
let (<>) f g =
  fun x -> f (g x)
```

Theorem:

For all (total) functions $f : b \rightarrow c$,

For all (total) functions $g : a \rightarrow b$,

For all trees $t : a \text{ tree}$,

$\text{tm } f (\text{tm } g t) == \text{tm } (f <\> g) t$

“Forall intro”

Theorem:

For all (total) functions $f : b \rightarrow c$,
For all (total) functions $g : a \rightarrow b$,
For all trees $t : \text{a tree}$,
 $\text{tm } f (\text{tm } g t) == \text{tm } (f \leftrightarrow g) t$

```
let rec tm f t =  
  match t with  
  | Leaf -> Leaf  
  | Node (x, l, r) -> Node (f x, tm f l, tm f r)  
  
let ( $\leftrightarrow$ ) f g =  
  fun x -> f (g x)
```

To begin, let's pick an arbitrary total function f and total function g . We'll prove the theorem without assuming any particular properties of f or g (other than the fact that the types match up). So, for the f and g we picked, we'll prove:

Theorem:

For all trees $t : \text{a tree}$,
 $\text{tm } f (\text{tm } g t) == \text{tm } (f \leftrightarrow g) t$

Another example

Theorem:

For all trees $t : \text{a tree}$,

$\text{tm } f (\text{tm } g t) == \text{tm } (f <\!\!> g) t$

```
let rec tm f t =
  match t with
  | Leaf -> Leaf
  | Node (x, l, r) -> Node (f x, tm f l, tm f r)
```

```
let (<\!\!>) f g =
  fun x -> f (g x)
```

Another example

Theorem:

For all trees $t : \text{a tree}$,

$$\text{tm } f (\text{tm } g t) == \text{tm } (f <\!\!> g) t$$

```
let rec tm f t =
  match t with
  | Leaf -> Leaf
  | Node (x, l, r) -> Node (f x, tm f l, tm f r)
```

```
let (<\!\!>) f g =
  fun x -> f (g x)
```

Case: $t = \text{Leaf}$

No inductive hypothesis to use.

(Leaf doesn't contain any smaller components with type tree.)

Proof:

$$\text{tm } f (\text{tm } g \text{ Leaf})$$

$$== \text{tm } f \text{ Leaf} \quad (\text{eval})$$

$$== \text{Leaf} \quad (\text{eval})$$

$$== \text{tm } (f <\!\!> g) \text{ Leaf} \quad (\text{reverse eval})$$

Another example

Theorem:

For all trees $t : \text{a tree}$,

$$\text{tm } f (\text{tm } g t) == \text{tm } (f <\!\!> g) t$$

Case: $t = \text{Node}(v, l, r)$

IH1: $\text{tm } f (\text{tm } g l) == \text{tm } (f <\!\!> g) l$

IH2: $\text{tm } f (\text{tm } g r) == \text{tm } (f <\!\!> g) r$

```
let rec tm f t =
  match t with
  | Leaf -> Leaf
  | Node (x, l, r) -> Node (f x, tm f l, tm f r)
```

```
let (<\!\!>) f g =
  fun x -> f (g x)
```

Another example

Theorem:

For all trees $t : \text{a tree}$,

$$\text{tm } f (\text{tm } g t) == \text{tm } (f <\!\!> g) t$$

Case: $t = \text{Node}(v, l, r)$

IH1: $\text{tm } f (\text{tm } g l) == \text{tm } (f <\!\!> g) l$

IH2: $\text{tm } f (\text{tm } g r) == \text{tm } (f <\!\!> g) r$

```
let rec tm f t =
  match t with
  | Leaf -> Leaf
  | Node (x, l, r) -> Node (f x, tm f l, tm f r)
```

```
let (<\!\!>) f g =
  fun x -> f (g x)
```

Proof:

$$\text{tm } f (\text{tm } g (\text{Node} (v, l, r)))$$

$$== \text{tm } (f <\!\!> g) (\text{Node} (v, l, r))$$

Another example

Theorem:

For all trees $t : \text{a tree}$,

$$\text{tm } f (\text{tm } g t) == \text{tm } (f <\!\!> g) t$$

Case: $t = \text{Node}(v, l, r)$

IH1: $\text{tm } f (\text{tm } g l) == \text{tm } (f <\!\!> g) l$

IH2: $\text{tm } f (\text{tm } g r) == \text{tm } (f <\!\!> g) r$

```
let rec tm f t =
  match t with
  | Leaf -> Leaf
  | Node (x, l, r) -> Node (f x, tm f l, tm f r)
```

```
let (<\!\!>) f g =
  fun x -> f (g x)
```

Proof:

$$\text{tm } f (\text{tm } g (\text{Node} (v, l, r)))$$

$$== \text{tm } f (\text{Node} (g v, \text{tm } g l, \text{tm } g r))$$

(eval inner tm)

$$== \text{tm } (f <\!\!> g) (\text{Node} (v, l, r))$$

Another example

Theorem:

For all trees $t : \text{a tree}$,

$$\text{tm } f (\text{tm } g t) == \text{tm } (f <> g) t$$

Case: $t = \text{Node}(v, l, r)$

IH1: $\text{tm } f (\text{tm } g l) == \text{tm } (f <> g) l$

IH2: $\text{tm } f (\text{tm } g r) == \text{tm } (f <> g) r$

```
let rec tm f t =
  match t with
  | Leaf -> Leaf
  | Node (x, l, r) -> Node (f x, tm f l, tm f r)
```

```
let (<>) f g =
  fun x -> f (g x)
```

Proof:

$$\text{tm } f (\text{tm } g (\text{Node} (v, l, r)))$$

$$== \text{tm } f (\text{Node} (g v, \text{tm } g l, \text{tm } g r))$$

(eval inner tm)

$\text{Node} ((f <> g) v, \text{tm } (f <> g) l, \text{tm } (f <> g) r)$

$$== \text{tm } (f <> g) (\text{Node} (v, l, r))$$

(eval reverse)

Another example

Theorem:

For all trees $t : \text{a tree}$,

$$\text{tm } f (\text{tm } g t) == \text{tm } (f <\!\!> g) t$$

Case: $t = \text{Node}(v, l, r)$

IH1: $\text{tm } f (\text{tm } g l) == \text{tm } (f <\!\!> g) l$

IH2: $\text{tm } f (\text{tm } g r) == \text{tm } (f <\!\!> g) r$

```
let rec tm f t =
  match t with
  | Leaf -> Leaf
  | Node (x, l, r) -> Node (f x, tm f l, tm f r)
```

```
let (<\!\!>) f g =
  fun x -> f (g x)
```

Proof:

$$\text{tm } f (\text{tm } g (\text{Node} (v, l, r)))$$

$$== \text{tm } f (\text{Node} (\textcolor{blue}{g v}, \text{tm } g l, \text{tm } g r))$$

(eval inner tm)

$$== \text{Node} (\textcolor{red}{f} (\textcolor{blue}{g v}), \textcolor{red}{tm } f (\text{tm } g l), \textcolor{red}{tm } f (\text{tm } g r))$$

(eval – since g, tm are total)

$$\text{Node} ((f <\!\!> g) v, \text{tm } (f <\!\!> g) l, \text{tm } (f <\!\!> g) r)$$

$$== \text{tm } (f <\!\!> g) (\text{Node} (v, l, r))$$

(eval reverse)

Another example

Theorem:

For all trees $t : \text{a tree}$,

$$\text{tm } f (\text{tm } g t) == \text{tm } (f <\!\!> g) t$$

Case: $t = \text{Node}(v, l, r)$

IH1: $\text{tm } f (\text{tm } g l) == \text{tm } (f <\!\!> g) l$

IH2: $\text{tm } f (\text{tm } g r) == \text{tm } (f <\!\!> g) r$

```
let rec tm f t =
  match t with
  | Leaf -> Leaf
  | Node (x, l, r) -> Node (f x, tm f l, tm f r)
```

```
let (<\!\!>) f g =
  fun x -> f (g x)
```

Proof:

$$\begin{aligned} & \text{tm } f (\text{tm } g (\text{Node} (v, l, r))) \\ & == \text{tm } f (\text{Node} (g v, \text{tm } g l, \text{tm } g r)) && \text{(eval inner tm)} \\ & == \text{Node} (f (g v), \text{tm } f (\text{tm } g l), \text{tm } f (\text{tm } g r)) && \text{(eval – since g, tm are total)} \end{aligned}$$

$$\begin{aligned} & \text{Node} ((f <\!\!> g) v, \text{tm } (f <\!\!> g) l, \text{tm } f (\text{tm } g r)) \\ & == \text{Node} ((f <\!\!> g) v, \text{tm } (f <\!\!> g) l, \text{tm } (f <\!\!> g) r) && \text{(IH2)} \\ & == \text{tm } (f <\!\!> g) (\text{Node} (v, l, r)) && \text{(eval reverse)} \end{aligned}$$

Another example

Theorem:

For all trees $t : \text{a tree}$,

$$\text{tm } f (\text{tm } g t) == \text{tm } (f <\!\!> g) t$$

Case: $t = \text{Node}(v, l, r)$

IH1: $\text{tm } f (\text{tm } g l) == \text{tm } (f <\!\!> g) l$

IH2: $\text{tm } f (\text{tm } g r) == \text{tm } (f <\!\!> g) r$

```
let rec tm f t =
  match t with
  | Leaf -> Leaf
  | Node (x, l, r) -> Node (f x, tm f l, tm f r)
```

```
let (<\!\!>) f g =
  fun x -> f (g x)
```

Proof:

$$\begin{aligned}
& \text{tm } f (\text{tm } g (\text{Node} (v, l, r))) \\
& == \text{tm } f (\text{Node} (g v, \text{tm } g l, \text{tm } g r)) && (\text{eval inner tm}) \\
& == \text{Node} (f (g v), \text{tm } f (\text{tm } g l), \text{tm } f (\text{tm } g r)) && (\text{eval - since } g, \text{tm} \text{ are total}) \\
& == \text{Node} ((f <\!\!> g) v, \text{tm } f (\text{tm } g l), \text{tm } f (\text{tm } g r)) \\
& == \text{Node} ((f <\!\!> g) v, \text{tm } (f <\!\!> g) l, \text{tm } f (\text{tm } g r)) && (\text{IH1}) \\
& == \text{Node} ((f <\!\!> g) v, \text{tm } (f <\!\!> g) l, \text{tm } (f <\!\!> g) r) && (\text{IH2}) \\
& == \text{tm } (f <\!\!> g) (\text{Node} (v, l, r)) && (\text{eval reverse})
\end{aligned}$$

Another example

Theorem:

For all trees $t : \text{a tree}$,

$$\text{tm } f (\text{tm } g t) == \text{tm } (f <\!\!> g) t$$

Case: $t = \text{Node}(v, l, r)$

IH1: $\text{tm } f (\text{tm } g l) == \text{tm } (f <\!\!> g) l$

IH2: $\text{tm } f (\text{tm } g r) == \text{tm } (f <\!\!> g) r$

```
let rec tm f t =
  match t with
  | Leaf -> Leaf
  | Node (x, l, r) -> Node (f x, tm f l, tm f r)
```

```
let (<\!\!>) f g =
  fun x -> f (g x)
```

Proof:

$$\begin{aligned}
& \text{tm } f (\text{tm } g (\text{Node} (v, l, r))) \\
& == \text{tm } f (\text{Node} (g v, \text{tm } g l, \text{tm } g r)) && (\text{eval inner tm}) \\
& == \text{Node} (\textcolor{red}{f (g v)}, \text{tm } f (\text{tm } g l), \text{tm } f (\text{tm } g r)) && (\text{eval} - \text{since } g, \text{tm} \text{ are total}) \\
& == \text{Node} (\textcolor{red}{(f <\!\!> g) v}, \text{tm } f (\text{tm } g l), \text{tm } f (\text{tm } g r)) && (\text{eval reverse}) \\
& == \text{Node} ((f <\!\!> g) v, \text{tm } (\text{f <\!\!> g}) l, \text{tm } f (\text{tm } g r)) && (\text{IH1}) \\
& == \text{Node} ((f <\!\!> g) v, \text{tm } (\text{f <\!\!> g}) l, \text{tm } (\text{f <\!\!> g}) r) && (\text{IH2}) \\
& == \text{tm } (\text{f <\!\!> g}) (\text{Node} (v, l, r)) && (\text{eval reverse})
\end{aligned}$$

Summary: Proof Template for Trees

```
type 'a tree = Leaf | Node of 'a * 'a tree * 'a tree
```

Theorem: For all $x : \text{'a tree}$, $\text{property}(x)$.

Proof: By induction on the structure of trees x .

Case: $x == \text{Leaf}$:

... no use of inductive hypothesis (this is the smallest tree) ...

Case: $x == \text{Node}(v, \text{left}, \text{right})$:

IH1: $\text{property}(\text{left})$

IH2: $\text{property}(\text{right})$

... use IH1 and IH 2 in your proof ...

A PROOF ABOUT EXPRESSIONS

A simple expression language

```
type id = string
```

```
type exp = Int of int | Add of exp * exp | Var of id
```

A simple expression language

```
type id = string
type exp = Int of int | Add of exp * exp | Var of id

let e1 = Add (Int 3, Var "x")
```

A simple expression language

```
type id = string  
type exp = Int of int | Add of exp * exp | Var of id
```

```
type env  
val lookup : env -> id -> int
```

A simple expression language

```
type id = string
type exp = Int of int | Add of exp * exp | Var of id

type env
val lookup : env -> id -> int

let rec eval (env: env) (e: exp) : int =
  Int i -> i
  | Add (e1, e2) -> (eval env e1) + (eval env e2)
  | Var x -> lookup env x
```

A simple optimizer

```
type id = string  
type exp = Int of int | Add of exp * exp | Var of id
```

```
type env  
val lookup : env -> id -> int
```

```
let rec eval (env: env) (e: exp) : int =  
  Int i -> i  
  | Add (e1, e2) -> (eval env e1) + (eval env e2)  
  | Var x -> lookup env x
```

```
let rec opt (e:exp) : exp =  
  Int i -> Int i  
  | Add (Int 0, e) -> opt e  
  | Add (e, Int 0) -> opt e  
  | Add (e1,e2) ->  
    Add(opt e1, opt e2)  
  | Var x -> Var x
```

A simple optimizer

```
type id = string
type exp = Int of int | Add of exp * exp | Var of id

type env
val lookup : env -> id -> int

let rec eval (env: env) (e: exp) : int =
  Int i -> i
  | Add (e1, e2) -> (eval env e1) + (eval env e2)
  | Var x -> lookup env x
```

```
let rec opt (e:exp) : exp =
  Int i -> Int i
  | Add (Int 0, e) -> opt e
  | Add (e, Int 0) -> opt e
  | Add (e1,e2) ->
    Add(opt e1, opt e2)
  | Var x -> Var x
```

Theorem:

For all $e : \text{exp}$, $\text{eval}(\text{opt } e) == \text{eval } e$

A simple optimizer

```
type id = string  
type exp = Int of int | Add of exp * exp | Var of id
```

```
type env  
val lookup : env -> id -> int
```

```
let rec eval (env: env) (e: exp) : int =  
  Int i -> i  
  | Add (e1, e2) -> (eval env e1) + (eval env e2)  
  | Var x -> lookup env x
```

```
let rec opt (e:exp) : exp =  
  Int i -> Int i  
  | Add (Int 0, e) -> opt e  
  | Add (e, Int 0) -> opt e  
  | Add (e1,e2) ->  
    Add(opt e1, opt e2)  
  | Var x -> Var x
```

Theorem:

For all $e : \text{exp}$, $\text{eval}(\text{opt } e) == \text{eval } e$

Proof: By induction on the structure of expressions $e : \text{exp}$.

A simple optimizer

```
type id = string  
type exp = Int of int | Add of exp * exp | Var of id
```

```
type env  
val lookup : env -> id -> int
```

```
let rec eval (env: env) (e: exp) : int =  
  Int i -> i  
  | Add (e1, e2) -> (eval env e1) + (eval env e2)  
  | Var x -> lookup env x
```

```
let rec opt (e:exp) : exp =  
  Int i -> Int i  
  | Add (Int 0, e) -> opt e  
  | Add (e, Int 0) -> opt e  
  | Add (e1,e2) ->  
    Add(opt e1, opt e2)  
  | Var x -> Var x
```

Theorem:

For all $e : \text{exp}$, $\text{eval}(\text{opt } e) == \text{eval } e$

Proof: By induction on the structure of expressions $e : \text{exp}$.

Case: $e = \text{Int } i$

$\text{eval}(\text{opt}(\text{Int } i))$

A simple optimizer

```
type id = string  
type exp = Int of int | Add of exp * exp | Var of id
```

```
type env  
val lookup : env -> id -> int
```

```
let rec eval (env: env) (e: exp) : int =  
  Int i -> i  
  | Add (e1, e2) -> (eval env e1) + (eval env e2)  
  | Var x -> lookup env x
```

```
let rec opt (e:exp) : exp =  
  Int i -> Int i  
  | Add (Int 0, e) -> opt e  
  | Add (e, Int 0) -> opt e  
  | Add (e1,e2) ->  
    Add(opt e1, opt e2)  
  | Var x -> Var x
```

Theorem:

For all $e : \text{exp}$, $\text{eval}(\text{opt } e) == \text{eval } e$

Proof: By induction on the structure of expressions $e : \text{exp}$.

Case: $e = \text{Int } i$

$$\begin{aligned} & \text{eval}(\text{opt}(\text{Int } i)) \quad (\text{RHS}) \\ == & \text{eval}(\text{Int } i) \quad (\text{eval of opt}) \end{aligned}$$

A simple optimizer

```
type id = string  
type exp = Int of int | Add of exp * exp | Var of id
```

```
type env  
val lookup : env -> id -> int
```

```
let rec eval (env: env) (e: exp) : int =  
  Int i -> i  
  | Add (e1, e2) -> (eval env e1) + (eval env e2)  
  | Var x -> lookup env x
```

```
let rec opt (e:exp) : exp =  
  Int i -> Int i  
  | Add (Int 0, e) -> opt e  
  | Add (e, Int 0) -> opt e  
  | Add (e1,e2) ->  
    Add(opt e1, opt e2)  
  | Var x -> Var x
```

Theorem:

For all $e : \text{exp}$, $\text{eval}(\text{opt } e) == \text{eval } e$

Proof: By induction on the structure of expressions $e : \text{exp}$.

Case: $e = \text{Int } i$

$$\begin{aligned} &\text{eval}(\text{opt}(\text{Int } i)) && (\text{RHS}) \\ &== \text{eval}(\text{Int } i) && (\text{eval of opt}) \end{aligned}$$

case done!
(we reached the LHS
from RHS)

A simple optimizer

```
type id = string  
type exp = Int of int | Add of exp * exp | Var of id
```

```
type env  
val lookup : env -> id -> int
```

```
let rec eval (env: env) (e: exp) : int =  
  Int i -> i  
  | Add (e1, e2) -> (eval env e1) + (eval env e2)  
  | Var x -> lookup env x
```

```
let rec opt (e:exp) : exp =  
  Int i -> Int i  
  | Add (Int 0, e) -> opt e  
  | Add (e, Int 0) -> opt e  
  | Add (e1,e2) ->  
    Add(opt e1, opt e2)  
  | Var x -> Var x
```

Theorem:

For all $e : \text{exp}$, $\text{eval}(\text{opt } e) == \text{eval } e$

Proof: By induction on the structure of expressions $e : \text{exp}$.

Case: $e = \text{Add}(\text{Int } 0, e2)$

IH: $\text{eval}(\text{opt } e2) == \text{eval } e2$

A simple optimizer

```
type id = string  
type exp = Int of int | Add of exp * exp | Var of id
```

```
type env  
val lookup : env -> id -> int
```

```
let rec eval (env: env) (e: exp) : int =  
  Int i -> i  
  | Add (e1, e2) -> (eval env e1) + (eval env e2)  
  | Var x -> lookup env x
```

```
let rec opt (e:exp) : exp =  
  Int i -> Int i  
  | Add (Int 0, e) -> opt e  
  | Add (e, Int 0) -> opt e  
  | Add (e1,e2) ->  
    Add(opt e1, opt e2)  
  | Var x -> Var x
```

Theorem:

```

```
let rec eval (env: env) (e: exp) : int =  
  Int i -> i  
  | Add (e1, e2) -> (eval env e1) + (eval env e2)  
  | Var x -> lookup env x
```

```
let rec opt (e:exp) : exp =  
  Int i -> Int i  
  | Add (Int 0, e) -> opt e  
  | Add (e, Int 0) -> opt e  
  | Add (e1,e2) ->  
    Add(opt e1, opt e2)  
  | Var x -> Var x
```

Theorem:

For all $e : \text{exp}$, $\text{eval}(\text{opt } e) == \text{eval } e$

Proof: By induction on the structure of expressions $e : \text{exp}$.

Case: $e = \text{Var } x$

$$\begin{array}{ll} \text{eval}(\text{opt}(\text{Var } x)) & (\text{LHS}) \\ == \text{eval}(\text{Var } x) & (\text{by eval opt}) \end{array}$$

A simple optimizer

```
type id = string  
type exp = Int of int | Add of exp * exp | Var of id
```

```
type env  
val lookup : env -> id -> int
```

```
let rec eval (env: env) (e: exp) : int =  
  Int i -> i  
  | Add (e1, e2) -> (eval env e1) + (eval env e2)  
  | Var x -> lookup env x
```

```
let rec opt (e:exp) : exp =  
  Int i -> Int i  
  | Add (Int 0, e) -> opt e  
  | Add (e, Int 0) -> opt e  
  | Add (e1,e2) ->  
    Add(opt e1, opt e2)  
  | Var x -> Var x
```

Theorem:

For all $e : \text{exp}$, $\text{eval}(\text{opt } e) == \text{eval } e$

Proof: By induction on the structure of e .

Case: $e = \text{Var } x$

$$\begin{aligned} &\text{eval}(\text{opt}(\text{Var } x)) && (\text{LHS}) \\ &== \text{eval}(\text{Var } x) && (\text{by eval opt}) \end{aligned}$$

case done!
(we showed the
 $\text{LHS} == \text{RHS}$)

A simple optimizer

```
type id = string  
type exp = Int of int | Add of exp * exp | Var of id
```

```
type env  
val lookup : env * id -> int
```

```
let rec eval (env: env) : exp ->  
  Int i -> i  
  | Add (e1, e2) -> eval e1 + eval e2  
  | Var x -> lookup (env, x)
```

```
let rec opt (e:exp) : exp =  
  Int i -> Int i  
  | Add (Int 0, e) -> opt e  
  | Add (e, Int 0) -> opt e  
  | Add (e1, e2) ->  
    opt (opt e1, opt e2)  
  | Var x -> Var x
```

PROOF DONE!!!

Proof:

Case: $e = \text{Var } x$

$\text{eval}(\text{opt}(\text{Var } x))$
 $= \text{eval}(\text{Var } x)$

(LHS
(by
opt)

LHS

e!
the
)

$\text{eval}(\text{opt } e) == \text{eval } e$

Summary of Template for Inductive Datatypes

type t = C1 of t1 | C2 of t2 | ... | Cn of tn

Theorem: For all $x : t$, $\text{property}(x)$.

Proof: By induction on structure of values x with type t .

use patterns
that divide
up the cases

Take inspiration
from the
structure of the
program

Case: $x == C1 v:$

... use IH on components of v that have type t ...

Case: $x == C2 v:$

... use IH on components of v that have type t ...

Case: $x == Cn v:$

... use IH on components of v that have type t ...

Exercise

```
type 'a tree = Leaf of 'a | Node of 'a tree * 'a tree
```

```
let rec flip (t: 'a tree) =  
  match t with  
  | Leaf _ -> t  
  | Node (a,b) -> Node (flip b, flip a)
```

Theorem: $\text{flip}(\text{flip } t) = t$.
