# Written Exam 2 Solutions

This exam has  $1010_2$  questions worth a total of  $64_{16}$  points. You have  $80_{10}$  minutes.

**Instructions.** This exam is preprocessed by computer. Write neatly, legibly, and darkly. Put all answers (and nothing else) inside the designated answer spaces. *Fill in* bubbles and checkboxes completely:  $\bullet$  and  $\blacksquare$ . To change an answer, erase it completely and redo.

**Resources.** The exam is closed book, except that you are allowed to use a one page reference sheet (8.5-by-11 paper, both sides, in your own handwriting). No electronic devices are permitted.

**Honor Code.** This exam is governed by Princeton's Honor Code. Discussing the contents of this exam before solutions are posted is a violation of the Honor Code.

Please complete the following information now.

# 1. Java keywords. (10 points)

For each Java keyword on the left, write the letter of the best-matching description from the right. Use each letter at most once.

D	public	А.	Defines a data type.
J	static	в.	Creates an object.
		C.	Specifies that a method has no return type.
С	void	D.	Indicates that a method can be called from another file.
K	throw	Е.	Provides a reference to the object whose instance method (or constructor) is being called.
Ι	final	F.	Provides a reference that does not refer to any object.
В	new	G.	Tells Java where to start the execution of a Java program.
		н.	Facilitates access to a library, such as java.awt.Color.
L	Item	I.	Prevents a variable from being modified after initialization.
Е	this	J.	Identifies a method or variable that belongs to the entire class (and not to an individual object).
A	class	К.	Creates a custom error that typically leads to a run-time exception.
Н	import	L.	Not a Java keyword.

## 2. Using data types. (9 points)

Assume that the variables  ${\tt s}$  and  ${\tt t}$  are initialized as follows:

```
String s = "ABABABABAB";
String t = "BABABABABA";
```

For each Java expression on the left, write the letter of the best-matching value (or description) from the right. Use each letter once, more than once, or not at all.

# 3. Creating and designing data types. (12 points)

Recall the Tracker data type from Programming Assignment 5. Initially, *lost mode* is disabled. Lost mode can be enabled by calling enableLostMode().

Consider the following partial implementation of a data type that represents a group of trackers:

```
public class GroupOfTrackers {
    private Tracker[] trackers;
   private int n;
   public GroupOfTrackers(Tracker[] trackers) {
        this.trackers = trackers;
        this.n = trackers.length;
    }
   public int numberInLostMode() {
        int count = 0;
        for (int i = 0; i < n; i++) {</pre>
            if (trackers[i].isInLostMode())
                count++;
        }
        return count;
    }
    . . .
    public static void main(String[] args) {
        Tracker a = new Tracker("watch", 40.34, -74.66);
        Tracker b = new Tracker("drone", 39.91, -77.02);
        Tracker c = new Tracker("phone", 59.22, 24.48);
        Tracker d = new Tracker("purse", 36.30, -60.00);
        Tracker[] trackers = { a, b, c, d };
        GroupOfTrackers x = new GroupOfTrackers(trackers);
        // MISSING CODE FRAGMENTS ON FACING PAGE
        StdOut.println(x.numberInLostMode());
   }
}
```

Suppose that you run the main() on the facing page with each of the code fragments below inserted into the designated place. What will be printed to standard output?

For each code fragment on the left, write the letter of the best-matching description from the right. Use each letter once, more than once, or not at all.

С	a.enableLostMode(); b.enableLostMode();	А.	0
		в.	1
A	<pre>a.enableLostMode(); b = a;</pre>	C.	2
	<pre>b.enableLostMode(); a.disableLostMode();</pre>	D.	3
		Е.	4
D	<pre>b.enableLostMode(); c.enableLostMode(); trackers[3] = a;</pre>	F.	5
	<pre>trackers[2] = d; a.enableLostMode(); c.disableLostMode();</pre>	G.	6
		н.	run-time exception

trackers = new Tracker[6]; trackers[4] = a; trackers[5] = b; a.enableLostMode(); d.enableLostMode();

# 4. Machine learning. (9 points)

Consider the following API for BinaryClassifier, which predicts whether a new patient will stay in a hospital for longer than 15 days based on the patient's vital signs at the time of admission.

```
public class BinaryClassifier {
    // creates a new BinaryClassifier
    public BinaryClassifier()
    // trains the classifier on the given file
    public void train(String filename)
    // returns the error rate on the given file
    // (0.0 for no errors, 1.0 for all errors)
    public double test(String filename)
}
```

You are provided with two files, testing.txt and training.txt. Each line in the file contains the vital signs of a patient at the time of admission, followed by +1 if the patient stayed longer than 15 days, and -1 otherwise. The files contain disjoint groups of patients, and all patients in testing.txt were admitted after the patients in training.txt.

For each client below, determine whether the binary classifier is *learning* to make correct predictions for *new* patients.

For each client, fill in the best-matching bubble.

client codereturn valueBinaryClassifier x = new BinaryClassifier();-x.train("training.txt");-double error = x.test("testing.txt");0.1

(b)client codereturn valueBinaryClassifier x = new BinaryClassifier();-double error1 = x.test("training.txt");0.3x.train("training.txt");-double error2 = x.test("training.txt");0.0

(c)

	client code		return value			
BinaryClassifi	<pre>BinaryClassifier x = new BinaryClassifier();</pre>					
double error1 :	<pre>double error1 = x.test("testing.txt");</pre>					
x.train("train	<pre>x.train("training.txt");</pre>					
double error2 :	0.1					
•	$\bigcirc$	$\bigcirc$				
learning	not learning	cannot be determine	ed			

### TOY REFERENCE CARD

### INSTRUCTION FORMATS

```
      | . . . . | . . . . | . . . . |

      Format RR:
      | opcode
      | d
      | s
      | t
      | (1-6, A-B)

      Format A:
      | opcode
      | d
      | addr
      | (7-9, C-F)
```

```
ARITHMETIC and LOGICAL operations
```

1:	add	R[d]	<-	R[s]	+	R[t]
2:	subtract	R[d]	<-	R[s]	-	R[t]
3:	and	R[d]	<-	R[s]	&	R[t]
4:	xor	R[d]	<-	R[s]	^	R[t]
5:	shift left	R[d]	<-	R[s]	<<	R[t]
6:	shift right	R[d]	<-	R[s]	>>	R[t]

### TRANSFER between registers and memory

7:	load address	R[d] <- addr
8:	load	R[d] <- M[addr]
9:	store	M[addr] <- R[d]
A:	load indirect	R[d] <- M[R[t]]
B:	store indirect	M[R[t]] <- R[d]

#### CONTROL

0:	halt	halt
C:	branch zero	if $(R[d] == 0) PC <- addr$
D:	branch positive	if $(R[d] > 0) PC <- addr$
E:	jump register	PC <- R[d]
F:	jump and link	R[d] <- PC; PC <- addr

```
16 16-bit registers: R[0] to R[F]
256 16-bit memory locations: M[00] to M[FF]
1 8-bit program counter: PC
```

```
R[0] always reads as 0000.
Loads from M[FF] come from stdin.
Stores to M[FF] go to stdout.
```

# 5. TOY programming. (8 points)

(a) Which value is stored in R[C] upon termination of the following TOY program?

Fill in the best-matching bubble.

10: 11: 12: 13:	7A11 R 8B12 R ACOA R 0000	[A] = 0011 [B] = M[12] [C] = M[R[A]]				
0000	0011	0012	000A	) 7A11	<b>8</b> B12	) ACOA

(b) What does the following TOY program print to standard output?

 $Fill\ in\ the\ best-matching\ bubble.$ 

10: 7AC 11: 7B1 12: EB1 13: 9AF 14: 9BF	CA .4 .5 FF	R[A] = 00CA R[B] = 0014 PC <- R[B] write R[A] write R[B]
15: FB1	.2	R[B] <- PC; PC <- 12
16: 9AF	7F	write R[A]
17: 000	00	halt

# 6. TOY machine. (12 points)

For each description on the left, write the letter of the best-matching power of 2 from the right. Use each letter once, more than once, or not at all.

		А.	$2^{0}$	(1)
С	Number of 1s in the binary representation of the decimal integer 226.	в.	$2^{1}$	(2)
	U U U U U U U U U U U U U U U U U U U	C.	$2^2$	(4)
[]		D.	$2^3$	(8)
Е	Assume 16-bit two's complement integer.	E.	$2^4$	(16)
		F.	$2^5$	(32)
M	Total number of <i>bits</i> of main memory in TOY	G.	$2^6$	(64)
	(including memory location FF).	н.	$2^7$	(128)
	Number of <i>bytes</i> that the TOY program counter stores.	I.	$2^8$	(256)
A		J.	$2^{9}$	(512)
		K.	$2^{10}$	(1,024)
C	Number of distinct <i>negative</i> integers representable in Java's int data type.	L.	$2^{11}$	(2,048)
5		м.	$2^{12}$	(4,096)
		N.	$2^{13}$	(8,192)
Ν	Value of the Java expression: $(-8192 \land -1) + 1$	0.	$2^{14}$	(16,384)
		Р.	$2^{15}$	(32,768)
		Q.	$2^{16}$	(65, 536)
		R.	$2^{20}$	(1,048,576)
		s.	$2^{31}$	(2, 147, 483, 648)
		т.	$2^{32}$	(4,294,967,296)

## 7. Algorithms. (10 points)

Implement a version of *binary search* that determines whether a key appears in an array whose elements are sorted in *descending order*.

(a) Complete the implementation of containsKey() by, for each oval numbered 1-5, choosing one of the expressions from the right. No other code is allowed.

Your answer should be a sequence of uppercase letters (corresponding to the labeled ovals). Use each letter at most once.

(b) Suppose that the length of a[] is 1 million and key does *not* appear in a[]. Assuming the binary search is implemented correctly, approximately how many times will the body of the while loop execute?

Fill in the best-matching bubble.

# 8. Data structures. (10 points)

Suppose that the following code fragment is used to initialize s, queue, and st:

```
String s = "BAABCA";
Queue<Integer> queue = new Queue<Integer>();
ST<Character, Stack<Integer>> st = new ST<Character, Stack<Integer>>();
for (int i = 0; i < s.length(); i++) {
    char c = s.charAt(i);
    if (!st.contains(c)) {
        st.put(c, new Stack<Integer>());
        queue.enqueue(i);
    }
    st.get(c).push(i);
}
```

For each code fragment on the left, write the letter of the best-matching output from the right. Use each letter at most once.

A	<pre>StdOut.println(st.size());</pre>	<b>A.</b> 3
		<b>B.</b> 5
C	<pre>while (!queue.isEmpty()) {</pre>	C. 0 1 4
C	<pre>StdOut.print(queue.dequeue() + " "); }</pre>	D. 1 2 3
		E. 2 3 1
	for $(char c \cdot st keys())$	<b>F.</b> 3 2 1
F	<pre>StdOut.print(st.get(c).size() + " "); }</pre>	G. 4 1 0
		H. 0 1 2 3 4 5
		I. 1 1 1 1 1 1
J	<pre>for (int i = 0; i &lt; s.length(); i++) {     char c = s.charAt(i);     char c = s.char c = s.char</pre>	J. 3 5 2 0 4 1
	<pre>StdUut.print(st.get(c).pop() + " "); }</pre>	K. 3 5 5 3 4 5
		L.543210

## 9. Theory of computing. (10 points)

(a) Describe the set of strings that the following DFA matches.Fill in the bubble corresponding to the best-matching description.

(b) Identify each statement below as known to be true, known to be false, or unknown.

true	false	unkno	wn
•	$\bigcirc$	$\bigcirc$	If you can design a Turing machine to solve some computational problem $X$ , then you can write a Java program to solve $X$ .
•	$\bigcirc$	$\bigcirc$	If you can write a Java program to solve some computational problem $X$ , then you can design a Turing machine to solve $X$ .
$\bigcirc$	•	$\bigcirc$	The Java compiler can identify all Java statements in a program that are <i>unreachable</i> (i.e., statements that can never be executed because there is no way for the program flow to reach it).
•	$\bigcirc$	$\bigcirc$	The Java compiler can determine whether a given .java file is a syntactically valid Java program.
$\bigcirc$	$\bigcirc$	•	It is possible to build a computational device based on solar eclipses that can solve the <i>halting problem</i> .
$\bigcirc$	•	$\bigcirc$	There exists a computational problem that can be solved on a DFA but not on a Turing machine.
$\bigcirc$		$\bigcirc$	A <i>universal Turing machine</i> is a Turing machine that can solve the halting problem.

### 10. Digital circuits. (10 points)

The 3-bit *even-parity* function f(x, y, z) is a boolean function of 3 variables that is 1 if an even number of its arguments are 1, and 0 otherwise. Which of the following represent the 3-bit even-parity function?

Fill in the corresponding bubbles.
