2.2 LIBRARIES AND CLIENTS

- designing libraries

sound synthesis

Standard random library

Goal. Design a library to generate pseudo-random numbers.

public class StdRandom

- static double uniformDouble(double lo, double hi)
- static boolean bernoulli(double p)
- static int uniformInt(int n)
- static double gaussian()
- static double gaussian(double mu, double sigma)
- static void shuffle(String[] a)
- static int discrete(int[] freq)

•

real number between 0 and 1 *real number between* lo and hi true with probability p, false otherwise *integer between* 0 *and* n-1 normal with mean 0 and stddev 1 normal with mean mu and stddev sigma shuffle the string array a[] i with probability proportion to freq[i]

Standard random implementation: random numbers from various distributions

Standard random implementation: random numbers from a Gaussian distribution

Standard random implementation: shuffling the elements in an array

Calling a library function

Calling from a client. Specify library name, dot operator, function name, and arguments.

Note. Must use fully qualified name if calling a function from another file.

Standard random clients

StdRandom client 1

~/cos126/libraries> java-introcs Shuffle A B C D E E A D B C

~/cos126/libraries> java-introcs Shuffle A B C D E C A E B D

~/cos126/libraries> java-introcs Shuffle 2C 2D 2H ... AS
4S 2D AC 9H QH 8C ... JS 4H 2S

StdRandom client 2

~/cos126/libraries> java-introcs RandomPoints 100000

What is the probability that the following code fragment prints "Paper" ?

if (StdRandom.uniformInt(3) == 0) {
 System.out.println("Rock");

else if (StdRandom.uniformInt(3) == 1) {
 System.out.println("Paper");

```
System.out.println("Scissors");
```

API, client, and implementation

Application programming interface (API). Specifies method headers and behavior for a library. Implementation. Program that implements the methods in an API. contract between **Client.** Program that uses a library through its API. client and implementation

implementation

public class StdRandom { public static int uniformInt(int n) { . . . public static void shuffle(String[] a) {

. . .

API, client, and implementation

Application programming interface (API). Specifies method headers and behavior for a library.Implementation. Program that implements the methods in an API.Client. Program that uses a library through its API.

client

API

implementation

Encapsulation. Separating clients from implementation details by hiding information.

Principle. A client does not need to know how a method is implemented in order to use it.

Benefits.

- Can develop client code and implementation code independently.
- Can change implementation details without breaking clients.

Private access modifier. Designates a method as not for use by a client.

- API does not list *private* methods.
- Compile-time error for client to call a *private* method.
- Advantage: implementation can add/remove *private* methods without impacting clients.

Java classpath. Places where Java looks for user-defined libraries (and other resources).

- Simplest: put library .class file in same directory as client program.
- Best practice: bundle library .class files in a .jar file; add .jar file to Java classpath. -

stdlib.jar contains: StdRandom.class StdIn.class StdOut.class StdDraw.class StdPicture.class StdAudio.class

Unit testing

Best practice. Include a *main()* method in each class as a test client.

- Call each public method at least once.
- Use result to check behavior.
- Identify failed tests programmatically.

```
public class StdRandom {
   public static void main(String[] args) {
      int n = Integer.parseInt(args[0]);
      for (int i = 0; i < n; i++) {
         StdOut.printf("%8.5f ", uniformDouble(10.0, 99.0));
         StdOut.printf("%5b " , bernoulli(0.5));
         StdOut.printf("%2d " , uniformInt(100));
         StdOut.printf("%7.5f ", gaussian(9.0, 0.2));
         StdOut.println();
                   unit tests for shuffle()
                      and other methods
```

minimum requirements (*in this course*)

~/cos126/libraries> java-introcs StdRandom 5

85.06009 false 8 8.88418 22.97440 true 40 9.18536 19.46492 false 28 8.89026 53.62835 true 90 8.90420 85.72239 false 5 8.78333

executes main() defined in this class

looks plausible (between 0 and 99)

Method header comments

Best practice. Every method should include a comment before the method header.

- Describe it purpose.
- Use names of parameter variables in description.
- Identify parameters, return value, and exceptions using Javadoc tags.

```
/**
 * Returns a random integer uniformly in [0, n).
 *
 * @param n number of possible integers
 * @return a random integer uniformly between 0 (inclusive) and n (exclusive)
 */
public static int uniformInt(int n) {
   return (int) (Math.random() * n);
}
```

Javadoc. Automatically generates API and documentation from Javadoc comments.

Class StdRandom

Object StdRandom

```
public final class StdRandom
extends Object
```

Overview. The StdRandom class provides static methods for generating random number from various discrete and continuous distributions, including uniform, Bernoulli, geometric, Gaussian, exponential, Pareto, Poisson, and Cauchy. It also provides method for shuffling an array or subarray and generating random permutations.

Conventions. By convention, all intervals are half open. For example, uniformDouble(-1.0, 1.0) returns a random number between -1.0 (inclusive) and 1.0 (exclusive). Similarly, shuffle(a, lo, hi) shuffles the hi – lo elements in the array a[], starting at index lo (inclusive) and ending at index hi (exclusive).

Performance. The methods all take constant expected time, except those that involve arrays. The *shuffle* method takes time linear in the subarray to be shuffled; the *discrete* methods take time linear in the length of the argument array.

Additional information. For additional documentation, see Section 2.2 of *Computer Science: An Interdisciplinary Approach* by Robert Sedgewick and Kevin Wayne.

2.2 LIBRARIES AND CLIENTS

sound synthesis

synthesizer library

OMPUTER CIENCE

An Interdisciplinary Appro

ROBERT SEDGEWICK KEVIN WAYNE

https://introcs.cs.princeton.edu

- random number library
- designing libraries

Sound is the perception the vibration of our eardrums.

Audio signal. Real-valued (between -1 and +1) function of time.

Pure tone. Sound wave defined by the sine function of given frequency, amplitude and duration.

 $y(t) = \sin\left(2\pi \cdot 2048 \cdot t\right), \quad 0 \le t \le T$ •

Goal. Convert a continuous-time signal into a discrete-time signal.

- A sample is a signal value at specific point in time.
- Take samples at evenly spaced points.

 $y(t) = \sin\left(2\pi \cdot 2048 \cdot t\right),$

 $a(t) = \sin\left(2\pi \cdot 2048 \cdot t\right),$

$$0 \leq t \leq T$$

$$t = \frac{0}{44100}, \frac{1}{44100}, \frac{2}{44100}, \dots$$

Review: standard audio API

StdAudio. Our library for playing, reading, and saving digital audio.

public class StdAudio

static int	SAMPLE_RATE
static void	play(String filename)
static void	playInBackground(String filename)
static void	play(double sample)
static void	play(double[] samples)
<pre>static void static double[]</pre>	<pre>play(double[] samples) read(String filename)</pre>
<pre>static void static double[] static void</pre>	<pre>play(double[] samples) read(String filename) save(String filename, double[] samples</pre>

44,100 (*CD quality audio*)

play the audio file

play the audio file in the background

play the sample

play the samples

read the samples from an audio file

mples) save the samples to an audio file

> • •

Sine wave implementation

```
public class Synth {
    public static int numberOfSamples(double duration) {
        return (int) (StdAudio.SAMPLE_RATE * duration);
    }
    private static double sine(double freq, double t) {
        return Math.sin(2 * Math.PI * freq * t);
    }
}
```

```
}
```

```
public static double[] sineWave(double freq, double amplitude, double duration) {
    int n = numberOfSamples(duration);
    double[] a = new double[n];
    for (int i = 0; i < n; i++) {
        double t = 1.0 * i / StdAudio.SAMPLE_RATE;
        a[i] = amplitude * sine(freq, t);
    }
    return a;
}
</pre>
```

$$a(t) = A \sin\left(2\pi \cdot f \cdot t\right), \quad t = \frac{0}{44100},$$

What sound will the following code fragment produce?

```
double freq = 17400.0;
double amplitude = 0.5;
double duration = 10.0;
double[] a = Synth.sineWave(freq, amplitude, duration);
StdAudio.play(a);
```

- A. Extremely high-pitched sound.
- **B.** Inaudible.
- C. Ultrasonic weapon.
- **D.** All of the above.

Crash course in Western music

- Concert A is 440 Hz.
- An octave is the interval between a note and one with twice its frequency.

MIDI (<i>m</i>)	frequency (Hz) $(440 \times 2^{(m-69)/12})$	sine wave
69	440	
70	466.16	
71	493.88	
72	523.25	
73	554.37	
74	587.33	
75	622.25	
76	659.26	
77	698.46	
78	739.99	
79	783.99	
80	830.61	
81	880	

Libraries and clients: quiz 3

Which of the following converts from MIDI note number to frequency?

- C. Both A and B.
- **D.** Neither A nor B.

MIDI-number-to-frequency conversion

Goal. Add methods (and constants) to library that many clients might want to use.

Musical Instrument Digital Interface (MIDI). Digital music standard.

Class constant.

- Declare and initialize "variable" outside of any method, using *final* and *static* modifiers.
- Access modifier can be *public* or *private*.
- Java naming convention: use SCREAMING_SNAKE_CASE.

```
public class Synth {
  public static final double CONCERT_A = 440.0;
  private static double midiToFrequency(int midi) {
     return CONCERT_A * Math.pow(2, (midi - 69) / 12.0);
   . . .
                frequency = 440 \times 2^{(midi - 69) / 12}
```

Major scale. Sequence of 8 notes in a specific interval pattern, starting with a root note and ending with the same note one octave higher.

Ex 1. C major scale.

Ex 2. A major scale.

interval pattern (major scale)

Musical scales

Major scale. Sequence of 8 notes in a specific interval pattern, starting with a root note and ending with the same note one octave higher.

```
public class MajorScale {
   public static void main(String[] args) {
      int root = Integer.parseInt(args[0]);
      double duration = 0.5;
      double amplitude = 0.5;
      int[] pattern = { 0, 2, 4, 5, 7, 9, 11, 12 };
      for (int i = 0; i < pattern.length; i++) {</pre>
         int midi = root + pattern[i];
         double freq = Synth.midiToFrequency(midi);
         double[] a = Synth.sineWave(freq, amplitude, duration);
         StdAudio.play(a);
```

interval pattern (*major scale*)

Goal. Read in a sequence of MIDI note numbers and durations from standard input, and play the synthesized results to standard audio.

Play that tune

Goal. Read in a sequence of MIDI note numbers and durations from standard input, and play the synthesized results to standard audio.

```
public class PlayThatTune {
   public static void main(String[] args) {
      double amplitude = 0.5;
      while (!StdIn.isEmpty()) {
         int midi = StdIn.readInt();
         double duration = StdIn.readDouble();
         double freq = Synth.midiToFrequency(midi);
         double[] a = Synth.sineWave(freq, amplitude, duration);
         StdAudio.play(a);
                                         [plays arpeggio]
                                     ())
```

```
[plays Looney Tunes theme]
())
```

- ~/cos126/libraries> java-introcs PlayThatTune < Arpeggio.txt</pre>
- ~/cos126/libraries> java-introcs PlayThatTune < LooneyTunes.txt</pre>

```
~/cos126/libraries> java-introcs PlayThatTune < FurElise.txt</pre>
   [plays beginning of Fur Elise]
```

2.2 LIBRARIES AND CLIENTS

sound synthesis

synthesizer library

OMPUTER CIENCE

An Interdisciplinary Appro

ROBERT SEDGEWICK KEVIN WAYNE

https://introcs.cs.princeton.edu

- random number library - designing libraries

Digital synth. Electronic musical instrument that generates audio signals digitally.

- Sound effects.
- Film and television soundtracks.
- Diverse genres of music (rock, jazz, pop, disco, hip-hop, electronic music, ...).
- •

Axel F (Harold Faltemeyer)

Synth. A library for synthesizing sound.

static int	CONCERT_A
static int	numberOfSamples(double duration)
static double	<pre>midiToFrequency(int midi)</pre>

static doubl	e	sineWave(double	freq,	double	amplitude
static doubl	e	squareWave(double	freq,	double	amplitude
static doubl	e	sawWa∨e(double	freq,	double	amplitude
static doubl	e	supersawWave(double	freq,	double	amplitude
static doubl	e	whiteNoise(double	amplitude

<pre>static double[]</pre>	<pre>superpose(double[]</pre>	a,	double[] b)
<pre>static double[]</pre>	<pre>modulate(double[]</pre>	a,	double[] b)
<pre>static double[]</pre>	fadeIn(double[]	a,	double lambda)
<pre>static double[]</pre>	fadeOut(double[]	a,	double lambda)

Square waves

Square wave. Alternates between +1 and -1 with frequency f, half the time at each value.

private static double square(double freq, double t) { return Math.signum(sine(freq, t)); } public static double[] squareWave(double freq, double amplitude, double duration) { /* similar to sineWave() */

implementation

Sawtooth waves

Sawtooth wave. Rises from -1 to +1 linearly, then drops back to -1, and repeats with frequency f.

public static double[] sawWave(double freq, double amplitude, double duration) { /* similar to sineWave() */

Sound envelope. Defines how a sound changes over time. Exponential fade. A sound envelope whose amplitude decays according to exponential function.

Exponential fade

```
public class Synth {
   public static double[] fadeOut(double[] a, double lambda) {
      int n = a.length;
      double[] result = new double[n];
      for (int i = 0; i < n; i++) {
         double t = 1.0 * i / StdAudio_SAMPLE_RATE;
         result[i] = a[i] * Math.pow(2.0, -lambda * t);
      return result;
   }
```

client

```
while (true) {
  double[] a = Synth.sineWave(440.0, 0.5, 1.0);
  double[] b = Synth.fadeOut(a, 10.0);
  StdAudio.play(b);
                                          -
}
```

What sound does StdAudio.play(mystery(5.0)) produce?

- A. 5 seconds of concert A (440 Hz).
- 5 seconds of a random frequency. B.
- 5 seconds of silence. С.
- 5 seconds of static. D.

```
public static double[] mystery(double duration) {
  int n = numberOfSamples(duration);
  double[] a = new double[n];
  for (int i = 0; i < n; i++) {
      a[i] = StdRandom.uniformDouble(-0.5, 0.5);
   return a;
```

White noise

White noise. Samples are uniformly random values.

```
public static double[] whiteNoise(double amplitude, double duration) {
    int n = numberOfSamples(duration);
    double[] a = new double[n];
    for (int i = 0; i < n; i++) {
        a[i] = StdRandom.uniformDouble(-amplitude, +amplitude);
    }
    return a;
}</pre>
```

Superposition. To combine two (or more) audio signals, add the corresponding samples.

Ex 1. Harmonics.

double duration = 5.0; double[] a4 = Synth.sineWave(440.0, 0.50, duration); double[] a3 = Synth.sineWave(220.0, 0.25, duration); double[] a5 = Synth.sineWave(880.0, 0.25, duration); double[] harmonics = Synth.superpose(a4, a3, a5); StdAudio.play(harmonics);

concert A with harmonics

Superposition. To combine two (or more) audio signals, add the corresponding samples.

- Ex 1. Harmonics.
- Ex 2. Chord.

```
double duration = 5.0;
double[] a4 = Synth.sineWave(440.00, 0.33, duration);
double[] c5 = Synth.sineWave(554.37, 0.33, duration);
double[] e5 = Synth.sineWave(659.26, 0.33, duration);
double[] chord = Synth.superpose(a4, c5, e5);
StdAudio.play(chord);
```

Superposition. To combine two (or more) audio signals, add the corresponding samples.

- **Ex 1.** Harmonics.
- Ex 2. Chord.
- Ex 3. Supersaw.

double freq = 220.0; *"detuned" frequencies* double amplitude = 0.05; double duration = 10.0; double[] a0 = Synth.sawWave(freq, double[] a1 = Synth.sawWave(freq - 0.191, amplitude, duration); double[] a2 = Synth.sawWave(freq - 0.109, amplitude, duration); double[] a3 = Synth.sawWave(freq - 0.037, amplitude, duration); double[] a4 = Synth.sawWave(freq + 0.031, amplitude, duration); double[] a5 = Synth.sawWave(freq + 0.107, amplitude, duration); double[] a6 = Synth.sawWave(freq + 0.181, amplitude, duration); double[] supersaw = Synth.superpose(a0, a1, a2, a3, a4, a5, a6); StdAudio.play(supersaw);

- amplitude, duration);

Slay that tune

Goal. Play that tune, but with a supersaw.

Synth library

```
public class Synth {
  public static final double CONCERT_A = 440.0;
                      numberOfSamples(double duration) { ... }
  public static int
  public static double midiToFrequency(int midi)
  private static double sine(double freq, double t) { ... }
  private static double square(double freq, double t) { ... }
  private static double saw(double freq, double t) { ... }
  public static double[]
  public static double[]
  public static double[]
  public static double[] supersawWave(double freq, double amplitude, double duration) { ... }
  public static double[]
  public static double[] superpose(double[] a, double[] b)
  public static double[] modulate(double[] a, double[] b)
  public static double[] fadeIn(double[] a, double lambda)
  public static double[] fadeOut(double[] a, double lambda)
   public static void main(String[] args) { ... }
```

API. Defines method headers and behavior for a library.Client. Program that calls a library's methods.Implementation. Program that implements the library's functionality.

Encapsulation. Separating clients from implementation details by hiding information.

Benefits.

- Reusable libraries.
- Independent development of small programs.
- Collaboration with a team of programmers.

Sound synthesis. You can write programs to synthesize sound.
