

# Software Engineering (Part 3)

Copyright © 2024 by  
Robert M. Dondero, Ph.D.  
Princeton University

# Objectives

- We will cover these software engineering topics:

Stages of SW dev

How to order the stages

- Requirements analysis
- Design
- Implementation
- Debugging
- Testing
- Evaluation
- Maintenance
- Process models

# Objectives

Software Engineering lecture slide decks:

Part 1	Requirements analysis Design (general)
Part 2	Design (object-oriented) Implementation Debugging
<b>Part 3</b>	<b>Testing</b> <b>Evaluation</b>
Part 4	Maintenance Process models

You're reasonably sure that your code is bug-free. What's next?

# Agenda

- Requirements analysis
- Design
- Implementation
- Debugging
- **Testing**
- Evaluation
- Maintenance
- Process models

# Testing

- **Debugging**: How can I **fix** the system?
- *Testing*: How can I **break** the system?

# Testing

- Testing taxonomy
  - Internal testing
  - External testing
    - White box
    - Black box
  - General strategies

# Testing: Internal

- ***Internal testing***
  - Designing your code to test itself
  - Done by *programmers*

# Testing: Internal

- Internal testing techniques
  - Check for function/method failures
  - Validate parameters
  - Check invariants
  - Leave testing code intact!!!

# Testing: Internal

## C: assert macro

```
assert(count >= 0);
```

Essentially same as:

```
if (count < 0)
{
    fprintf(stderr,
            "assertion failed: (count >= 0),");
    fprintf(stderr,
            "function XXX, file YY, line ZZ.");
    exit(134);
}
```

Asserts are **enabled** by default; to **disable** asserts:

```
gcc -D NDEBUG somefile.c
```

# Testing: Internal

## Python: `assert` statement

```
assert count >= 0, 'count is < 0'
```

Essentially same as:

```
if count < 0:  
    raise AssertionError('count is < 0')
```

Asserts are **enabled** by default; to **disable** asserts:

```
python -O somefile.py
```

# Testing: Internal

**Java:** `assert` statement (since JDK 1.4)

```
assert count >= 0 : "count is < 0";
```

Essentially same as:

```
if (count < 0)
    throw new AssertionError("count is < 0");
```

Asserts are **disabled** by default; to **enable** asserts:

```
java -ea SomeFile.java
```

# Testing: Internal

## JavaScript (browsers):

`console.assert` function

```
console.assert(count >= 0, 'count is < 0');
```

Essentially same as:

```
if (count < 0)  
    console.log('count is < 0');
```

**Cannot be disabled???**

# Testing: Internal

## JavaScript (Node.js): `assert` function

```
const assert = require('assert');  
...  
assert(count >= 0);
```

Essentially same as:

```
if (count < 0)  
  throw new Error(  
    'The expression evaluated to a falsy value');
```

**Cannot be disabled!**

# Testing: Internal

- Assert controversy: enable or disable asserts in production code?

# Testing: External

- *External testing*
  - Designing code or data to test your code

# Testing: External: White Box

- ***White box* external testing**
  - External testing with knowledge of structure of tested code
  - Done by **programmers**

# Testing: External: White Box

- White box external testing techniques
  - *Statement testing*
    - Testing to make sure each **statement** is executed at least once
  - *Path testing*
    - Testing to make sure each **logical path** is followed at least once

# Testing: External: White Box

- White box external testing techniques
  - ***Boundary (corner case) testing***
    - Testing with input values at, just below, and just above limits of input domain
    - Testing with input values causing output values to be at, just below, and just above the limits of the output domain

*Glossary of Computerized System and Software Development Terminology*

# Testing: External: White Box

- Tool support for statement testing
  - **Python: *coverage***
    - See Assignments 1-4
    - Another example...

# Testing: External: White Box

- Statement testing of fractionclient.py
  - See **statementtesting/**
    - euclid.py
    - fraction.py
    - fractionclient.py
    - buildandrun
    - buildandrun.bat

# Testing: External: White Box

- Statement testing of fractionclient.py

```
$ ./buildandrun  
  
# Create file .coverage  
python -m coverage run frac2client.py  
Numerator 1: 1  
Denominator 1: 2  
Numerator 2: 3  
Denominator 2: 4  
frac1: 1/2  
frac2: 3/4  
...
```

# Testing: External: White Box

- Statement testing of fractionclient.py

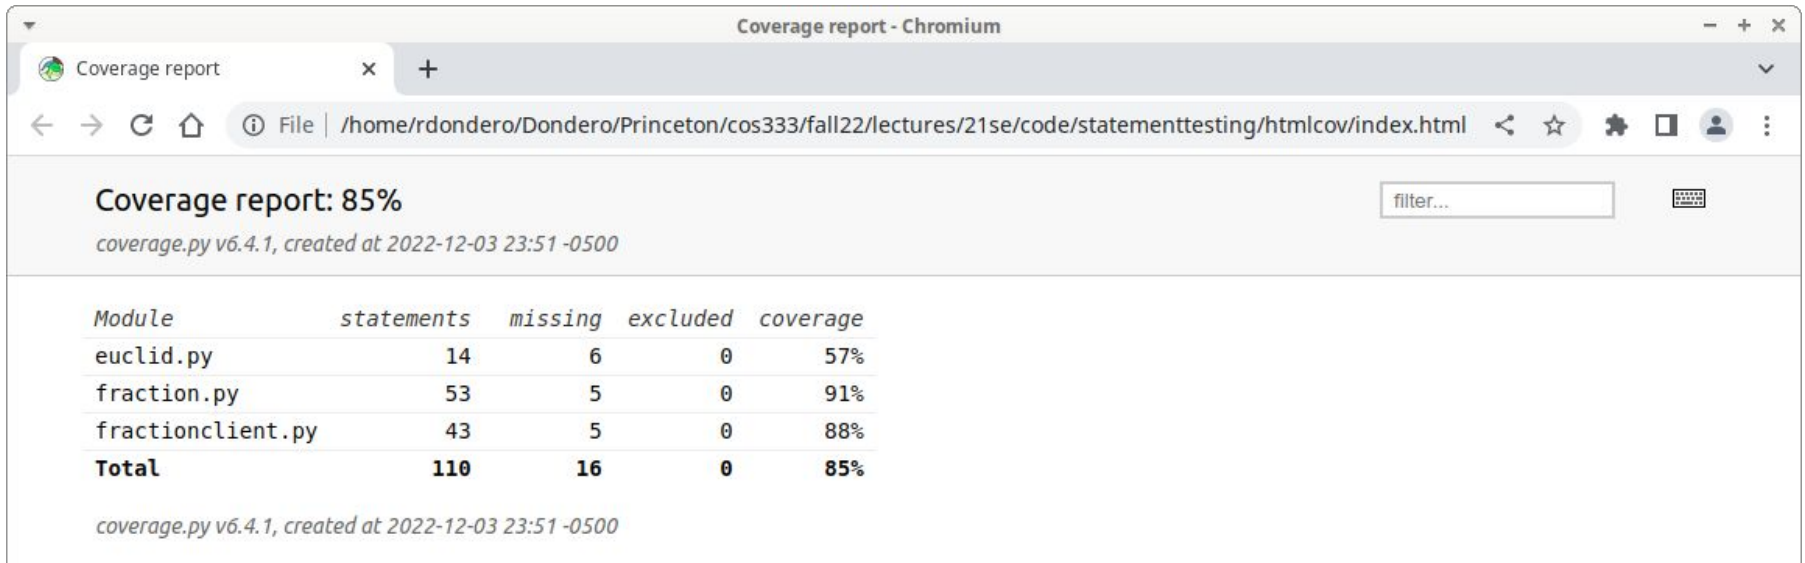

```
...
frac1 hashcode: -3550055125485641917
frac1 does not equal frac2
frac1 is less than frac2
frac1 is less than or equal to frac2
-frac1: -1/2
frac1 + frac2: 5/4
frac1 - frac2: -1/4
frac1 * frac2: 3/8
frac1 / frac2: 2/3

# Create directory htmlcov
python -m coverage html

# View the results, htmlcov/index.html, using a browser
$
```

# Testing: External: White Box

- Statement testing of fractionclient.py

The screenshot shows a web browser window titled "Coverage report - Chromium". The address bar displays the URL: `/home/rdondero/Dondero/Princeton/cos333/fall22/lectures/21se/code/statementtesting/htmlcov/index.html`. The main content area shows a "Coverage report: 85%" with a search filter box labeled "filter...". Below this, a table provides a summary of coverage for various modules. The table has five columns: "Module", "statements", "missing", "excluded", and "coverage". The rows are: "euclid.py" (14 statements, 6 missing, 0 excluded, 57% coverage), "fraction.py" (53 statements, 5 missing, 0 excluded, 91% coverage), "fractionclient.py" (43 statements, 5 missing, 0 excluded, 88% coverage), and a "Total" row (110 statements, 16 missing, 0 excluded, 85% coverage). At the bottom, it notes "coverage.py v6.4.1, created at 2022-12-03 23:51 -0500".

Module	statements	missing	excluded	coverage
euclid.py	14	6	0	57%
fraction.py	53	5	0	91%
fractionclient.py	43	5	0	88%
<b>Total</b>	<b>110</b>	<b>16</b>	<b>0</b>	<b>85%</b>

coverage.py v6.4.1, created at 2022-12-03 23:51 -0500

# Testing: External: White Box

Coverage for euclid.py: 57%

14 statements 8 run 6 missing 0 excluded

# Testing: External: Black Box

- ***Black box* external testing**
  - External testing without knowledge of structure of tested code
  - Done by *quality assurance (QA) engineers*

# Testing: External: Black Box

- Black box external testing techniques
  - ***Use case testing***
    - Testing driven by use cases developed during design
  - ***Stress testing***
    - Testing with a large quantity of data
    - Testing with a large variety of (random?) data

# Testing: General Strategies

- **General testing strategies**
  - Automate the testing
    - To test your **programs**: create **scripts**
    - To test your **modules**: create software **clients**
    - Compare implementations when possible

# Testing: General Strategies

- Tool support for automating testing
  - **Python: *PyUnit***
    - Example...

# Testing: General Strategies

- Automated testing of fraction.py
  - See [testautomationgood/](#)
    - euclid.py
    - fraction.py
    - **testfraction.py**
      - Instead of fractionclient.py
      - Uses PyUnit
    - **buildandrun**
    - **buildandrun.bat**

# Testing: General Strategies

```
$ ./buildandrun

# Run unit tests
python testfraction.py
.....
-----
-----
Ran 5 tests in 0.000s

OK
$
```

# Testing: General Strategies

- Automated testing of fraction.py
  - See **testautomationbad/**
    - euclid.py
    - **fraction.py**
      - Contains a logic error
    - testfraction.py
    - buildandrun
    - buildandrun.bat

# Testing: General Strategies

```
$ ./buildandrun

# Run unit tests
python testfraction.py
..F..
=====

# Testing: General Strategies

- General testing strategies (cont.)
  - Test incrementally
    - Use scaffolds and stubs
    - Do *regression testing*
  - Let debugging drive testing
    - Reactive mode
    - Proactive mode: do *fault injection*

# Testing: Summary

- Testing taxonomy
  - Internal testing
  - External testing
    - White box
    - Black box
  - General strategies

You've tested your code to make sure it meets your expectations. What's next?

# Agenda

- Requirements analysis
- Design
- Implementation
- Debugging
- Testing
- **Evaluation**
- Maintenance
- Process models

# Evaluation

- **Testing**

- Does the system meet **your (the programmer's)** expectations?

- ***Evaluation***

- Does the system meet **the users'** expectations?
- Does the system fulfill the needs of its users?

# Evaluation

- Kinds of evaluation
  - By users
    - Actually, by software engineers in collaboration with users
  - By evaluation experts

# Evaluation: Users

- Questionnaires
- **Interviews**
- Focus groups
- Direct observation

Recall  
requirements  
gathering  
techniques

# Evaluation: Users

- Conducting interviews
  - (1) Recruit a set of users
  - (2) If necessary, compose a short written intro to your system
  - (3) Compose a written task sequence
    - Maybe ***abstracted from*** use cases developed during design

# Evaluation: Users

- Conducting interviews (cont.)
  - (4) For each user:
    - (4.1) If necessary, give the user the short intro, ask the user to read it, and confirm that the user understands it
    - (4.2) Give the user the task sequence
    - (4.3) For each task:
      - (4.3.1) Ask the user to read the task and confirm that the users understands it
      - (4.3.2) Ask the user to use your system to perform the task
      - (4.3.3) Ask (force!!!) the user to talk aloud while performing the task

# Evaluation: Users

- Conducting interviews (cont.)
  - (5) Take copious notes
  - (6) Audio/video record?
  - (7) Repeat for each kind of user

# Evaluation: Experts

Jakob  
Nielsen

# Evaluation: Experts

- *Heuristic Evaluation*
  - From Jakob Nielsen
  - For evaluating the **whole** system **generally**
  - Using these 10 heuristics...

# Evaluation: Experts

- ***Heuristic Evaluation***

- **(1) Visibility of system status**

- **The system should always keep users informed** about what is going on, through appropriate feedback within reasonable time.

# Evaluation: Experts

- ***Heuristic Evaluation***
  - **(2) Match between system and the real world**
    - **The system should speak the user's language**, with words, phrases and concepts familiar to the user, rather than system-oriented terms. Follow real-world conventions, making information appear in a natural and logical order.

# Evaluation: Experts

- ***Heuristic Evaluation***

- **(3) User control and freedom**

- **Users often choose system functions by mistake and will need a clearly marked "emergency exit" to leave the unwanted state without having to go through an extended dialogue. Support undo and redo.**

# Evaluation: Experts

- *Heuristic Evaluation*

- **(4) Consistency and standards**

- Users should not have to wonder whether different words, situations, or actions mean the same thing. **Follow platform conventions.**

# Evaluation: Experts

- ***Heuristic Evaluation***

- **(5) Error prevention**

- **Even better than good error messages is a careful design which prevents a problem from occurring** in the first place. Either eliminate error-prone conditions or check for them and present users with a confirmation option before they commit to the action.

# Evaluation: Experts

- *Heuristic Evaluation*

- **(6) Recognition rather than recall**

- Minimize the user's memory load by **making objects, actions, and options visible**. The user should not have to remember information from one part of the dialogue to another. Instructions for use of the system should be visible or easily retrievable whenever appropriate.

# Evaluation: Experts

- *Heuristic Evaluation*

- **(7) Flexibility and efficiency of use**

- Accelerators—unseen by the novice user—may often speed up the interaction for the expert user such that the system can cater to both inexperienced and experienced users. **Allow users to tailor frequent actions.**

# Evaluation: Experts

- ***Heuristic Evaluation***

- **(8) Aesthetic and minimalist design**

- **Dialogues should not contain information which is irrelevant or rarely needed.** Every extra unit of information in a dialogue competes with the relevant units of information and diminishes their relative visibility.

# Evaluation: Experts

- ***Heuristic Evaluation***

- **(9) Help users recognize, diagnose, and recover from errors**
  - **Error messages should be expressed in plain language** (no codes), precisely indicate the problem, and constructively suggest a solution.

# Evaluation: Experts

- *Heuristic Evaluation*

- **(10) Help and documentation**

- Even though it is better if the system can be used without documentation, it may be necessary to **provide help and documentation**. Any such information should be easy to search, focused on the user's task, list concrete steps to be carried out, and not be too large.

# Evaluation: Experts

- For more info on heuristic evaluation:
  - Wikipedia article:  
[https://en.wikipedia.org/wiki/Heuristic\\_evaluation](https://en.wikipedia.org/wiki/Heuristic_evaluation)
  - Helen Sharp, Jenny Preece, Yvonne Rogers. *Interaction Design: Beyond Human-Computer Interaction*.
  - Nielsen, Jakob. *Usability Engineering*.

# Evaluation: Experts

- **Cognitive Walkthrough**
  - From Cathleen Wharton, Jakob Nielsen
  - For evaluating **part** of the system in **detail**

Repeatedly:

**Will the correct action be sufficiently evident to the user?**

Will the user know what to do to achieve the task?

**Will the user notice that the correct action is available?**

Can users see the button or menu item that they should use for the next action?

**Will the user associate and interpret the response from the action correctly?**

Will users know from the feedback that they have made the correct or incorrect choice of action?

Yvonne Rogers, Helen Sharp, Jenny Preece. *Interaction Design: Beyond Human-Computer Interaction (3<sup>rd</sup> Edition)*. Wiley, 2011.

So the system is finished. Or is it?
