

Inheritance and subclasses

- **a way to create or describe one class in terms of another**
 - "a D is like a B, with these extra properties..."
 - "a D is a B, plus..."
 - B is the **base** class or **superclass**
 - D is the **derived** class or **subclass**
 - Perl, C++ use base/derived; Java uses super/sub
- **inheritance used for classes that model strongly related concepts**
 - objects share some properties, behaviors, etc.
 - and have some properties and behaviors that are different
- **real-world example: GUI "widgets" or "controls"**
 - aspects common to all widgets:
 - position, size, background color, caption, ...
 - aspects different for different kinds of widgets:
 - how to draw, responses to events, ...
- **one class is a natural extension of the other**
 - sometimes you care about the difference
 - drawing: a button is not a pull-down menu is not a text area
 - sometimes you don't
 - set/get caption, set background color, get dimensions

Subclasses

widget

widget

button

widget

scrollbar

```
class Widget {
    int bgcolor;
    // other vars common to all Widgets
}
class Button extends Widget {
    int state;
    // other vars specific to Buttons
}
class Scrollbar extends Widget {
    int min, max, current;
    // other vars specific to Scrollbars
}
```

- **a Button is a subclass (a kind of) Widget**
 - inherits all members of Widget
 - adds its own members
- **a Scrollbar is also a subclass of Widget**

Object hierarchy

- all objects are derived from class `Object`

`Object`

- > `Math`
- > `System`
- > `Component` -> `Container` -> `JComponent` ...
- > `InputStream` -> `FilterInputStream` -> `BufferedInputStream`

- `Object` has methods for `equals`, `hashCode`, `toString`, `clone`, etc.
 - normally these are extended

- **assignment vs cloning:**

```
r1 = r2; // refer to the same object
r1 = r2.clone(); // two separate objects
```

- **default `X.equals` is `Object.equals`**

- tests for same reference, i.e., same object

- **for other definitions of equality, overload `equals`**

```
class X {
    String str;
    public boolean equals(X r2) {
        return str.equals(r2.str);
    }
}
```

Virtual functions

- all functions are implicitly *virtual*
- if a reference to a superclass type is really a reference to a subclass object, a function call with that reference calls the subclass function
- **polymorphism: proper function to call is determined at run-time**
 - e.g., drawing `Widgets` in an array:

```
draw(Widget[] wa) {
    for (int i = 0; i < wa.length; i++)
        wa[i].draw();
}
```

- **virtual function mechanism automatically calls the right `draw()` function for each object**
 - a subclass may provide its own version of this function, which will be called automatically for instances of that subclass
 - the superclass can provide a default implementation
- **the loop does not change if more subclasses of widgets are added**

Exceptions are objects

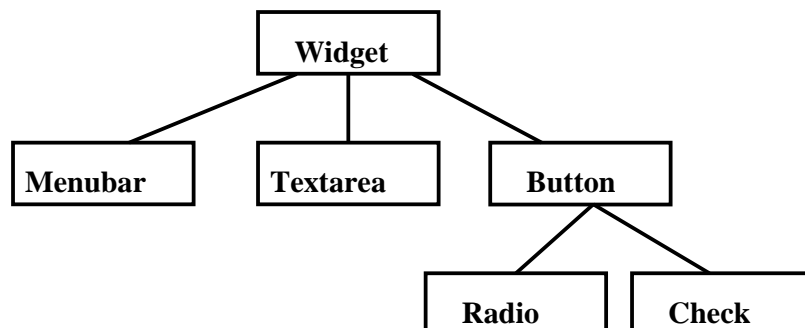

- all derived from class `Exception`
- multiple catch blocks to catch multiple exceptions (most specific first)
- you can define your own exceptions

```
public class except2 {
    public static void main(String[] args) throws EndOfTheWorld {
        try {
            FileInputStream fin = new FileInputStream(args[0]);
            // etc.
        } catch (FileNotFoundException e) {
            System.err.println("FileNotFoundException " + e);
        } catch (IOException e) {
            System.err.println("IOException " + e);
        } catch (Exception e) {
            e.printStackTrace();
            throw new EndOfTheWorld("repent!");
        }
    }
}

class EndOfTheWorld extends Exception {
    EndOfTheWorld(String s) {
        System.err.println(s + " the end of the world is at hand.");
    }
}
```

Inheritance principles

- classes should match the natural objects in the application
- derive specific types from a general type
 - collect common properties in the superclass
 - add special properties in the subclasses
- distinctions are not always clear
 - is a text field a special kind of text area?
 - is a menubar more than an array of buttons?
 - is a radiobutton a special kind of button?
 - is a checkbutton a radiobutton or vice versa or neither?

Interfaces

- **an interface is like a class**
- **declares a type**
- **only declares methods (not implementations)**
 - and constants ("final")
 - methods are implicitly public
 - constants are implicitly public static final
- **any class can implement the interface**
 - i.e., provide implementations of the interface methods
 - and can provide other methods as well
 - and can implement several interfaces
- **the only way to simulate function pointers and function objects**

Comparison interface for sorting

```
interface Cmp {
    int cmpf(Object x, Object y);
}
class Icmp implements Cmp { // Integer comparison
    public int cmpf(Object o1, Object o2) {
        int i1 = ((Integer) o1).intValue();
        int i2 = ((Integer) o2).intValue();
        if (i1 < i2) return -1;
        else if (i1 == i2) return 0;
        else return 1;
    }
}
class Scmp implements Cmp { // String comparison
    public int cmpf(Object o1, Object o2) {
        String s1 = (String) o1;
        String s2 = (String) o2;
        return s1.compareTo(s2);
    }
}
```

- **whole lot of casting going on**
- **can't do an illegal cast, but don't find out till runtime**

Sort function using an interface

```
void sort(Object[] v, int left, int right, Cmp cf) {
    int i, last;

    if (left >= right) // nothing to do
        return;
    swap(v, left, rand(left,right));
    last = left;
    for (i = left+1; i <= right; i++)
        if (cf.cmpf(v[i], v[left]) < 0)
            swap(v, ++last, i);
    swap(v, left, last);
    sort(v, left, last-1, cf);
    sort(v, last+1, right, cf);
}

Integer[] iarr = new Integer[n];
String[] sarr = new String[n];
Quicksort.sort(iarr, 0, n-1, new Icmp());
Quicksort.sort(sarr, 0, n-1, new Scmp());
```

Wrapper types

- **most library routines work on Objects**
 - don't work on basic types like int
- **have to "wrap" basic types in objects to pass to library functions, store in Vectors, etc.**
 - Character, Integer, Float, Double, etc.
- **wrappers also include utility functions and values**

```
Integer I = new Integer(123); // constructor
int i = I.intValue(); // get value
i = Integer.parseInt("123"); // atoi
I = Integer.valueOf("123"); // ...
String s = I.toString();
Double D = new Double(123.45);
double d = D.doubleValue();
d = Double.parseDouble("123.45"); // atof
D = Double.valueOf("123.45"); // ...
String s = D.toString();
double atof(String str) {
    return Double.parseDouble(str);
}
System.out.println(Double.MAX_VALUE);
```

Boxing and unboxing

- Java 1.5 autobox and unbox somewhat clean up this mess

```
Integer I = 123; // no need for new Integer()
int i = I; // no need for I.intValue()
String s = I.toString();
```

```
Double D = 123.45;
double d = D;
d = Double.parseDouble("123.45"); // atof
D = Double.valueOf("123.45");
s = D.toString();
```

Boxing and unboxing pitfalls

- What does this print? (courtesy of Josh Bloch)

```
public class box {
    public static void main(String[] args) throws IOException {
        cmp(new Integer(42), new Integer(42));
    }

    static void cmp(Integer first, Integer second) {
        if (first < second)
            System.out.printf("%d < %d\n",
                first, second);
        else if (first == second)
            System.out.printf("%d == %d\n",
                first, second);
        else if (first > second)
            System.out.printf("%d > %d\n",
                first, second);
    }
}
```

Collections and collections framework

- **"collection" == container in C++, etc.**
 - Set, List (includes array), Map
- **interfaces for standard data types**
 - abstract data types for collections
 - can do most operations independently of real type
 - include standard interface for add, remove, size, member test, ...
- **implementations (concrete representations)**
 - HashSet, TreeSet
 - ArrayList, LinkedList
 - HashMap, TreeMap
- **algorithms**
 - standard algorithms like search and sort
 - work on any Collection of any type
 - that provides standard operations like comparison
 - "polymorphic"
- **iterators**
 - uniform mechanism for accessing each element

Collections sort

- **ArrayList is an implementation of List**
 - like Vector but better
 - adds some of its own methods, like get()
- **Collections.sort is a polymorphic algorithm**
 - specific type has to implement Comparable

```
class qsort1 {
    public static void main(String[] argv) throws IOException {
        FileReader f1 = new FileReader(argv[0]);
        BufferedReader f2 = new BufferedReader(f1);
        String s;
        List al = new ArrayList();
        while ((s = f2.readLine()) != null)
            al.add(s);
        Collections.sort(al);
        for (int j = 0; j < al.size(); j++)
            System.out.println(al.get(j));
    }
}
```

Interface example: map

- interface defines methods for something
- says nothing about the implementation

```
interface Map
    void put(String name, String value);
    String get(String name);
    // ...
}
```

- classes implement it by defining functions
- have to implement all of the interface

```
class HashMap implements Map {
    Hashtable h;
    HashMap() { h = new Hashtable(); }
    void put(String name, String value) {h.put(name, value); }
    String get(String name) { return h.get(name); }
```

```
class TreeMap implements Map {
    RBTree t;
    TreeMap() { t = new RBTree(); }
    void put(String name, String value) { ... }
    String get(String name) { ... }
```

Word frequency counter

- count number of occurrences of each word

```
Map hs = new TreeMap(); // or HashMap
String buf;
while ((buf = f2.readLine()) != null) {
    String nv[] = buf.split("[ ]+");
    for (int i = 0; i < nv.length; i++) {
        Integer oldv = (Integer) hs.get(nv[i]);
        if (oldv == null)
            hs.put(nv[i], new Integer(1));
        else
            hs.put(nv[i], new Integer(oldv.intValue()+1));
    }
}
for (Iterator it = hs.keySet().iterator(); it.hasNext(); ) {
    String n = (String) it.next();
    Integer v = (Integer) hs.get(n);
    System.out.println(v + " " + n);
}
```

Boxing, unboxing

- **boxing cleans up bulky wrapper code**

```
Map<String, Integer> hs = new HashMap<String, Integer>();

String buf;
while ((buf = f2.readLine()) != null) {
    String nv[] = buf.split("[ ]+");
    for (int i = 0; i < nv.length; i++) {
        Integer oldv = hs.get(nv[i]);
        if (oldv == null)
            hs.put(nv[i], 1);
        else
            hs.put(nv[i], oldv+1);
    }
}
for (String n : hs.keySet()) {
    Integer v = hs.get(n);
    System.out.println(v + " " + n);
}
```

Generics, for-each

- **generics tell compiler what type a Collection holds**
 - compiler can do more type checking at compile time
- **for-each loop cleans up iterator code**

```
String s;
List<String> al = new ArrayList<String>();
while ((s = f2.readLine()) != null)
    al.add(s);
Collections.sort(al);
for (String j : al)
    System.out.println(j);
```

- **<?> as a type in a generic matches any type**
- **<? extends T> matches any type that extends T**
 - "bounded wildcard"

Sorting: Java v. C++

```
String s;
List<string> al = new ArrayList<string>();
while ((s = f2.readLine()) != null)
    al.add(s);
Collections.sort(al);
for (String j : al)
    System.out.println(j);
```

```
string tmp;
vector<string> v;
while (getline(cin, tmp))
    v.push_back(tmp);
sort(v.begin(), v.end());
copy(v.begin(), v.end(),
     ostream_iterator<string>(cout, "\n"));
```

Add up a bunch of numbers: Java v. C++

```
while ((buf = f2.readLine()) != null) {
    String nv[] = buf.split("[    ]+");
    for (int i = 0; i < nv.length; i++) {
        try {
            dsum += Double.parseDouble(nv[i]);
        } catch (NumberFormatException e) {
            ;
        }
    }
}
```

```
while (getline(cin, tmp)) {
    istringstream iss(tmp);
    string s;
    while (iss >> s) {
        dsum += atof(s.c_str());
    }
}
```

Word frequency count: Java

```
public class freqhash {
    public static void main(String args[]) throws IOException {
        FileReader f1 = new FileReader(args[0]);
        BufferedReader f2 = new BufferedReader(f1);

        Map<String, Integer> hs = new HashMap<String,Integer>(10000);
        String buf;
        while ((buf = f2.readLine()) != null) {
            String nv[] = buf.split("[ ]+");
            for (int i = 0; i < nv.length; i++) {
                Integer oldv = hs.get(nv[i]);
                if (oldv == null)
                    hs.put(nv[i], 1);
                else
                    hs.put(nv[i], oldv+1);
            }
        }
        for (String n : hs.keySet()) {
            Integer v = hs.get(n);
            System.out.println(v + " " + n);
        }
    }
}
```

Word frequency count: C++ STL

```
#include <iostream>
#include <map>
#include <string>

int main() {
    string temp;
    map<string, int> v;
    map<string, int>::const_iterator i;

    while (cin >> temp)
        v[temp]++;
    for (i = v.begin(); i != v.end(); ++i)
        cout << i->first << " " << i->second << "\n";
}
```
