3.2 Binary Search Trees

▶ BSTs

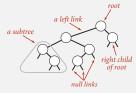

ordered operations

deletion

Binary search trees

Definition. A BST is a binary tree in symmetric order.

- A binary tree is either:
- Empty.
- Two disjoint binary trees (left and right).

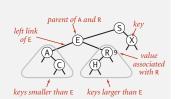

Anatomy of a binary tree

Symmetric order.

Each node has a key, and every node's key is:

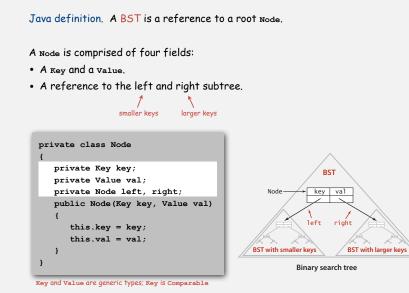

- Larger than all keys in its left subtree.
- Smaller than all keys in its right subtree.

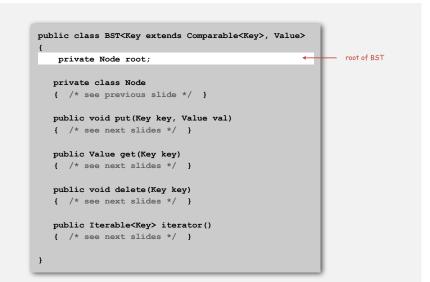

Anatomy of a binary search tree

BST representation in Java

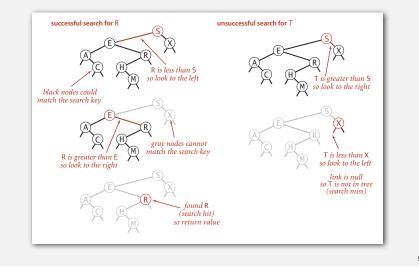

BST implementation (skeleton)

BST search

Get. Return value corresponding to given key, or null if no such key.

BST search: Java implementation

Get. Return value corresponding to given key, or null if no such key.

<pre>public Value get(Key key) {</pre>
Node x = root;
while (x != null)
{
<pre>int cmp = key.compareTo(x.key);</pre>
if $(cmp < 0) x = x.left;$
else if $(cmp > 0) x = x.right;$
<pre>else if (cmp == 0) return x.val;</pre>
}
return null;
}

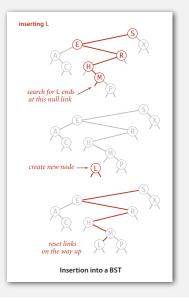

Running time. Proportional to depth of node.

BST insert

Put. Associate value with key.

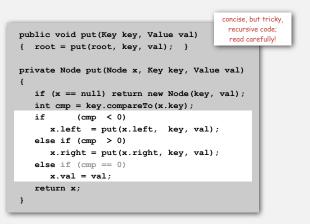

Search for key, then two cases:

- Key in tree \Rightarrow reset value.
- Key not in tree \Rightarrow add new node.

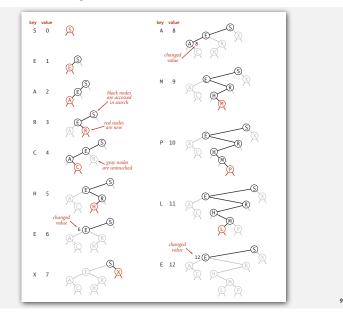

BST insert: Java implementation

Put. Associate value with key.

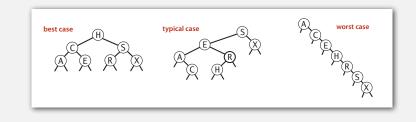

Running time. Proportional to depth of node.

BST trace: standard indexing client

Tree shape

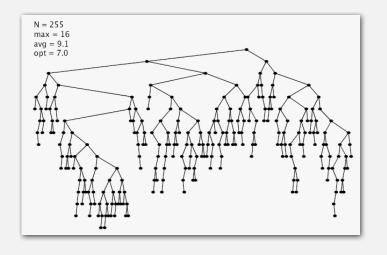

- Many BSTs correspond to same set of keys.
- Cost of search/insert is proportional to depth of node.

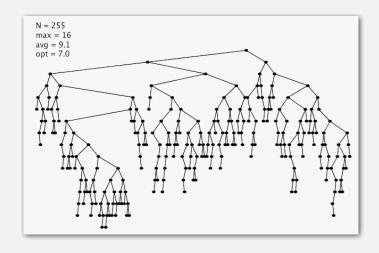

BST insertion: random order

Observation. If keys inserted in random order, tree stays relatively flat.

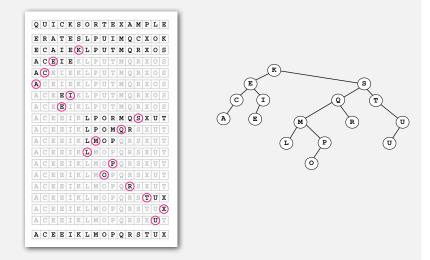

BST insertion: random order visualization

Ex. Insert keys in random order.

Correspondence between BSTs and quicksort partitioning

Remark. Correspondence is 1-1 if no duplicate keys.

...

BSTs: mathematical analysis

Proposition. If keys are inserted in random order, the expected number of compares for a search/insert is ~ 2 ln N.

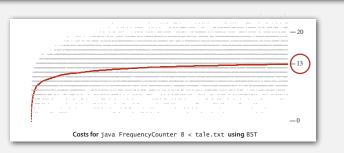

Pf. 1-1 correspondence with quicksort partitioning.

Proposition. [Reed, 2003] If keys are inserted in random order, expected height of tree is ~ 4.311 ln N.

But... Worst-case for search/insert/height is N. (exponentially small chance when keys are inserted in random order)

ST implementations: summary

implementation	guarantee		average case		ordered	operations
	search	insert	search hit	insert	ops?	on keys
sequential search (unordered list)	N	N	N/2	Ν	no	equals()
binary search (ordered array)	lg N	Ν	lg N	N/2	yes	compareTo()
BST	N	Ν	1.39 lg N	1.39 lg N	2	compareTo()

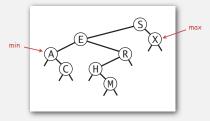

15

Minimum and maximum

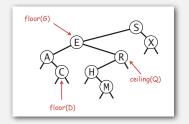

Minimum. Smallest key in table. Maximum. Largest key in table.

Q. How to find the min / max.

Floor and ceiling

Floor. Largest key ≤ to a given key. Ceiling. Smallest key ≥ to a given key.

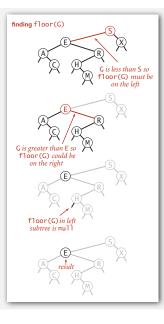

Q. How to find the floor /ceiling.

Computing the floor

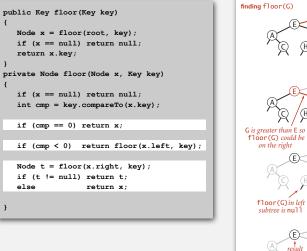

Case 1. [k equals the key at root] The floor of k is k.

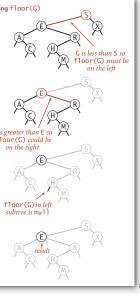

Case 2. [k is less than the key at root] The floor of k is in the left subtree.

Case 3. [k is greater than the key at root] The floor of k is in the right subtree (if there is any key ≤ k in right subtree); otherwise it is the key in the root.

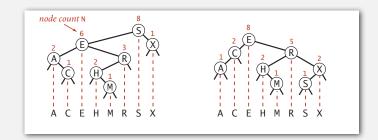

Computing the floor

Subtree counts

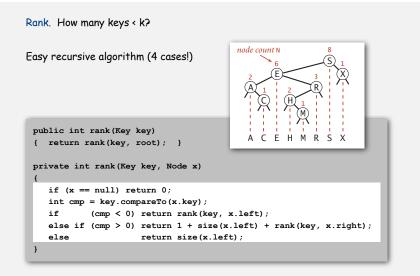

In each node, we store the number of nodes in the subtree rooted at that node. To implement size(), return the count at the root.

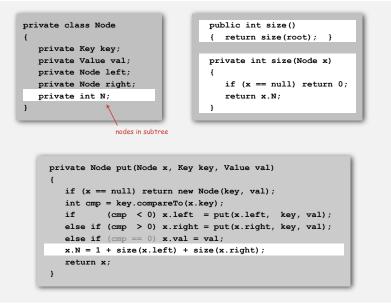

Remark. This facilitates efficient implementation of rank () and select().

21

Rank

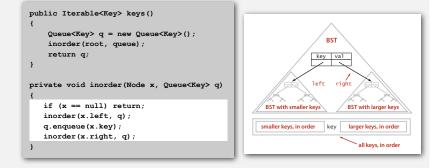

BST implementation: subtree counts

Inorder traversal

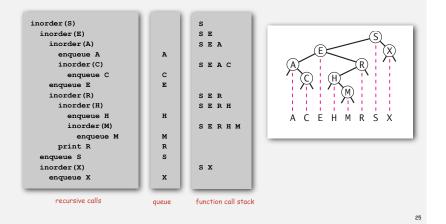

- Traverse left subtree.
- Enqueue key.
- Traverse right subtree.

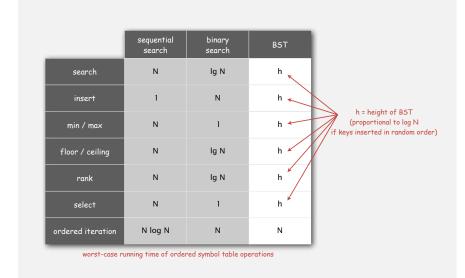

Property. Inorder traversal of a BST yields keys in ascending order.

Inorder traversal

- Traverse left subtree.
- Enqueue key.
- Traverse right subtree.

BST: ordered symbol table operations summary

ST implementations: summary

implementation searc	guarantee			average case			ordered	operations
	search	insert	delete	search hit	insert	delete	iteration?	on keys
sequential search (linked list)	N	N	N	N/2	N	N/2	no	equals()
binary search (ordered array)	lg N	N	N	lg N	N/2	N/2	yes	compareTo()
BST	N	N	N	1.39 lg N	1.39 lg N	222	yes	compareTo()

28

BSTs

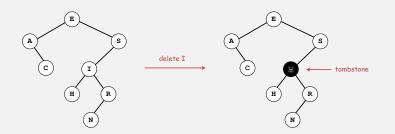

ordered operations

→ del<u>etion</u>

BST deletion: lazy approach

To remove a node with a given key:

- Set its value to null.
- Leave key in tree to guide searches (but don't consider it equal to search key).

Cost. O(log N') per insert, search, and delete (if keys in random order), where N' is the number of key-value pairs ever inserted in the BST.

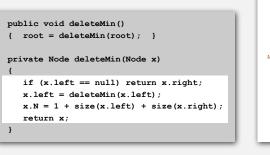

Unsatisfactory solution. Tombstone overload.

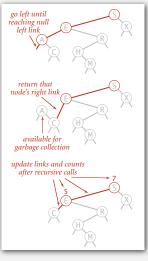

29

Deleting the minimum

To delete the minimum key:

- Go left until finding a node with a null left link.
- Replace that node by its right link.
- Update subtree counts.

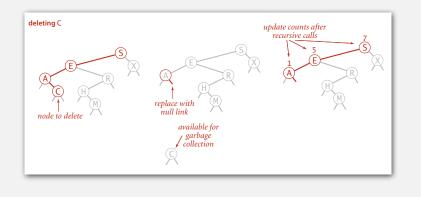

Hibbard deletion

To delete a node with key k: search for node t containing key k.

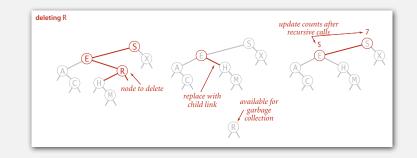

Case 0. [O children] Delete t by setting parent link to null.

Hibbard deletion

To delete a node with key k: search for node t containing key k.

Case 1. [1 child] Delete t by replacing parent link.

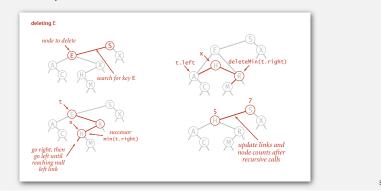

Hibbard deletion

To delete a node with key k: search for node t containing key k.

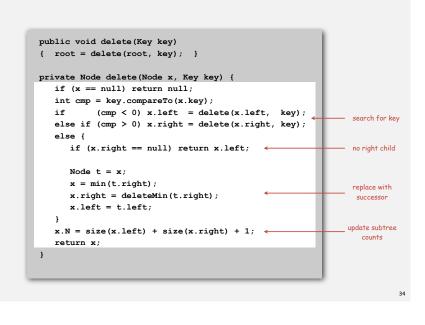

Case 2. [2 children]

- Find successor x of t.
- Delete the minimum in t's right subtree.
- Put x in t's spot.

× has no left child
 but don't garbage collect x
 still a BST

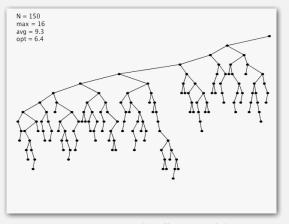

Hibbard deletion: Java implementation

Hibbard deletion: analysis

Unsatisfactory solution. Not symmetric.

Surprising consequence. Trees not random (!) \Rightarrow sqrt(N) per op. Longstanding open problem. Simple and efficient delete for BSTs.

ST implementations: summary

implementation	guarantee			average case			ordered	operations
	search	insert	delete	search hit	insert	delete	iteration?	on keys
sequential search (linked list)	N	N	N	N/2	Ν	N/2	no	equals()
binary search (ordered array)	lg N	Ν	N	lg N	N/2	N/2	yes	compareTo()
BST	Ν	N	N	1.39 lg N	1.39 lg N	\sqrt{N}	yes	compareTo()
					other	operations a if deletions	lso become √N allowed	

Next lecture. Guarantee logarithmic performance for all operations.
